The sweete yellow climing Virginian Insmine. This Virginian Ia mine hath a pretty bigge wooddy flocke next to the ground, from whence rife fundry hard stalkes, dividing it selfe into many branches, foreading very farre upon the trees, or any thing standeth next to it, whereon are fet at severall small diflances, two pretty large Mirtle-like fmooth leaves, but placed on contrary fides, each above other, as they are disposed in the double Syringa Arabica, or Pipetree: the flowers fland three or foure together, at the yellow climing yellow Iasmine of Virginia,

Gelfeminum five Lasminum Indicum stavum odoratissimum, 🐠

luteum O.rginiazum oderatum [candens femper vuens.

The most sweete yellow Indian Lasmine. And the sweete

ends of the branches, somewhat like unto the former Jasmines, with a long hollow trunke, ending in five points, but not laid open into leaves like them, of a yellow colour, smelling very sweete, after which follow small, somewhat flat and long smooth yellow pods, parted in the middle all the length, full of small flat brownish feedes, winged as it were or skinny at the one end, and piled close one upon another in each side of the pod.

The Place and Time. The three first forts have beene brought, as it is thought out of Syria into Spaine, where they thrive passing well. The first fort, which they account to be wilde, serveth to graft the other two upon, that they may grow and this ive the better; we keepe the second with much care and provision, being more tender then the first, which is growing in many places of the Land, in private persons gardens: but the third, I have not heard that it hath beene as yet brought unto us, it being as yet more rare, and as tender to keepe, if not more then the fecond. The fourth is held doubtfull whether it came from the East Indies, China, or Lapan, or the West Indies, for divers doe suppose the one and the other. The fifth groweth in Virginia, as Master Tradescant, who saw is there doth affirme, and from him I have a plant rifen of the feede. They all flower late, and none of them beare any feede with us. The Names.

The Arabians call the Iasmine Zambach, and Sambach, and Iasemin as it is thought, from the Greeke word Iasme, which fignifieth Violaceum, it hath no other Greeke name, unleffe as fome thinke it be the Pothos albus of Theophrafu. The first is called I sminum or Gelseminum vulgatiun & albam, by all Authours. The second is called Iasminum, or Gelleminum grandius & Catalonicum, but by Lugdunensis Islaminum puniceum. The third is mentioned onely by Ferrarius, in his Flora or destorm cultura. The fourth by him also, yet mentioned in the Catalogue of the French Kings Garden at Paris. The fifth was never mentioned by any before, and but that Mafter Tradefcant sconfident to call it a lasmine, and therefore I am content to put it with the rest to give him content, I would be further informed of it my felfe, before I would certainely give my confent.

The Vertues. Serapio delivereth it, that the white Iasmine is not in the beginning of the second degree, that it discusses humours, is good against falt flegme, profitable to old cold men, and profitable for cararrhs, and the griefes that spring from tough flegane : the leaves either greene or dry, doe clenfe freckles, spots, and discolouring in the face or elfewhere, and helpeth tetters, or ring wormes, and the like sit is not fit that those that are of an hot constitution should acthis, for this breedeth the headache. The flowers are very fweete, and therefore they ferve to ffrow in the house for an ornament and good sent, they use also in the warme Countries to lay the slowers among their gloves

Iiiiii a

CHAP.51.

or fine linnen, to give the better fent. The cyle that is made of the flowers by intolation is good for any cold part of the body to warme it, and to ease the paines of the crampe, and flitching in the fides.

CHAP. LI.

Polemonium five Trifolium fruticans vel lafminum luteum vulgare. Shrub Trefoile or the ordinary yellow lasmine.

Lthough as I faid in the Chapter before, this plant is not of the Islamines, yet bersule it hath by time obtained that name, and that the flowers thereof in forme refemble she white Islamine, I thought it good tained that name, and that the nowers the to me their chapter. It fpreadeth white rootes to joyne it next unto them, because I would not put it into their Chapter. It fpreadeth white rootes in the ground farre about, rising up in tundry places with many tall and slender twiggy branches, green

at the first, but after of a darke grayish colour, whereon are tet at severall distances, three small darke greene leaves together on every stalke, the end leafe being the biggest : at the joynts with the leaves come forth the flowers, each fingly by it felfe upon a stalke which are long and hollow, ending in five leaves usually, yet fometimes in fixe, very like unto the flowers of the white Iasmine but yellow, and thereupon it was called a vellow Iasmine, which being past, there follow other round blacke flaining berries of the bignesse of a great Pease or bigger, full of a purplish juyce which will colour ones fingers that shall bruise them.

The Place and Time. This groweth plentifully about Mompelier, and abideth well any where in our Country: it flowreth in Iuly, but we seldome see ripe fruite the con.

The Names. It is called Polemanium Monspelienfium by Gesner, Lobel, Cameratius and Lugdunenfis, and Trifolium fruticans by Dodonam and Tabermontaniu, who also calleth it Ruta baccifera five trifulia, and Gefner Ruta capraria Gallorum Monfelienfium, and by fome Iafminum luteum Italicum, yet Columns ca'leth it, Iasmini species trifolia non videtur ad Polemonium accedere, B. fler in borto Eystetensi, sheweth one with foure leaves, that are greener, and not to sharpe pointed, and Banhinus Iasminum lutenmunlgo dictum,bacciferum, who allo giveth this note of it, that at Mempelier it is often found but with one leafe alone upon a stalke. although in Gardens it hath three. It is very doub: full whether it should be the Polemenium of Dioscorides or no, for you have here the judgement of Columna, non videtur ad P lemonium accedere, although Lebel wou'd ir ake it agree in all things. Some would make it therefore a e grifus, but it agree. In thereto in nothing, but in having three leaves to-gether. We cannot learne what Italian, French, or Dutch name it hath, but in English it may be called Shrubbe Trefoile, according to the Latine, but Gerard faith, it is called Make bare, yet I know not where nor by whom: it is usually called now adaies the yellow Iasmine from the likenesse of the flowers.

Polemonium frue Trifolium frueicans vel la minum luteum vulgare. Shrubbe Trefoile, or the

ordinary vellow Infinine.

The Vertues.

We know not of any knowne property it hath for certaine, and therefore to give you the particular Vertues of Polemonium, when as peradventure not any one can belong thereunto, were needeleffe, and the ground of a great errour.

CHAP. LII.

Syringa. The Pipe tree.

Lthough I have thewed you thefe five forts of Pipetrees in my former Booke, yet I thinke it not unfit to present you with them agains here, and give you a full description of that sort that was defective there.

1. Lilac Matthioli five Syringa flore caruleo. The blew Pipe tree or Lilac.

The blew Pipe tree rifeth sometimes to be as great as a meane apple, yet usually it groweth nothing fogreat, having oftentimes suckers rising from the roote, the younger branches being covered with a grayish greene barke, and the elder with a darker, having within them a pith like the Elder, with two faire broad, smooth deepe greene leaves, small pointed at the ends, set at every joyat, which are some distance one from another, many of them folding the leaves inwards, standing on long sootestalkes: at the toppes of many of the branches come forth many leave believe blanches. of the branches come forth many long hollow blewish purple flowers, ending in five leaves, in a long tust toge1. Liles fen Syringe flave caraleo. The blew Pipe tree or Lilas.

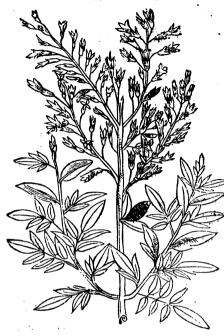

TRIBE 16.

3. Syringa Perfica five Lilas folijs incifis Perlicam, lefminum Perficum

4 Syrings flore alba fimp ict. The fingle white Pipe tice.

5. Springa Arabica flore duplici. The double white Pipe tice.

TRIBEIG.

ther hanging downe, and are of a small tent; the flowers being past, there come some simes, but not often in our Country long and flat cods, confifting as it were of two fides, with a thin skin in the middle, wherein are contain ned two long flattish red feede : the rootes are strong and grow deepe in the ground.

2. Lilac five Syringa flore latteo five argenteo. The filver coloured Pipe tree.

This Pipe tree different not from the former, either in stemme or branch, either in lease or flowers, or manner of growing from the last, but onely in the colour of the flower, which is of a milky filver colour, which bath a shew of blew therein, comming somewhat neere unto an ashcolour.

3. Syringa Persica sive Lilao Persicum incisis folys lasminum Persicum dictum. The blew Persian Ialmine or Pipe tree.

This Persian Iasmine (or Persian Lilac, whether you will) is a shrub of shrubby plant, never rising into a tree like the former, yeelding many twigges, or stems and suckers from the roote, whose wood is fost having a pich in the middle, as the other, feldome rifing above a mans height, having a smooth blackish greene barke, with fundry winged leaves thereon, on all fides, fome whereof as well those below as above, will be whole without any division therein, resembling a Privet leafe, others will be cut in on the one side or the other, or both, and divers will be halfe like, or wholly like the posture, and divisions of the Catalonian Iastine resembling it to necesty that thereby it came to be called a latimine: at the toppes of the sprigs and branches stand many tuits of flowers. in a long fpike, of four eleaves a poece, folke unto the former Lilac, that at the first view of them you may truely. define it to be a Lilac, the colour onely excepted, which in this is more purplish, and of as sweete a sent or rather stronger: after the flowers are past, follow the like small long blackish seede, inclosed in somewhat long and pointed haskes like the former but lester. This doth in every part, except the growth and leaves, come need to our ordinary Lilac, and doth in nothing but the leaves refemble a Iasmine: for both the wood is white and pithy and the flowers grow in tufes or fpikes, and appeare in May when no laimine doth, but the Lilac: the feedlike wife is contained in hard buskes, as the Lilac and not as the lasmine, like a Lupine, of a soft substance, and lastly the talle of this is somewhat harsh, with some astriction in the end, and the Iasmine hath a bitter sharpe biting talle. and very aftringent withall. Yet as I faid before, this is most likely to be Serapio his blew Iasmine. The roote fpreadeth many branches with fibres to them, under ground, and may very well be propagated by the fuckers. this holdeth his greene leaves in the Winter, no more then the others doe.

This affuredly is the Iafminum carnleum of Scrapio, whereof formerly there was great doubt among Herbariffs whether there were such a thing in rerum natura, very many denying it, because they either never saw this or ne-

ver confidered it.

4. Syringa flore albo simplies. The single white Pipe tree.

This Buth never beareth any great ftem or body, but shooteth forth most usually many pliant brownish twice or fhootes, and grayifh when they grow elder, being pithy in the middle like the former, at each joynt fland two leaves formewhat like the former, but more rugged or crumpled, a little pointed at the ends, and dented about the edges: the flowers grow at the toppes of the branches, many fet together, confifting of foure leaves, as large as the Muske Rofes, and of the same creame colour, with many small yellow threds in the middle, of a strong sweet, full and leady fent, not pleasing to a great many, by reason of the strong quickenesse of the sent: after which followeth the fruite flat at the head, with many leafy scales compassing it, wherein is enclosed small long seed: the rootes runne not deepe into the ground, but ipread with many fibres thereat.

5. Springs Arabica flore duplici. The double white Pipe tree.

The double Pipe tree from a fhort thicke thumpe, not rifing high above the ground. shootesh forth divers long and flender branches, whereon grow large leaves, force what like unto the laft, but not forough or hard, nor dented at all about the edges, two alwaies flanding one against another at the joynts, but fet or disposed on contrary fides, and not upon two onely; at the ends whereof come forth three or foure flowers, every one on a flake by it telfe, which are long and hollow below, like the white Iafmine, and have a double row of white round pointed leaves, five or fixe in a row at the toppe, feeming like unto a double white Islamine flower but larger, with fome yellownesse in the middle, which is hollow, of a very strong and heady sweete sent like the single kinde, and abide long flowring, especially in the hotter Countries, but is very tender, and not abiding the least cold weather with us, the cold windes greatly molesting it in the hotter Countries, and must therefore be kept with us as charily as Orenge trees, or rather more.

The Place and Time.

The first groweth in Arabia as Matthiolus thinketh, who had it from Constantinople: but now is plentifully to be found in many Gardens of our Land as well as others. The fecond is a stranger with us as yet. The third is very like to come first out of Persia, as the name importeth, it is now to be seene with Master Tradescant, at South Lambeth. The fourth is almost as frequent as the first, but the original place is not certainely knowne. The last hath the originall from Arabia, as the name importeth. The first, second, and third, doe flower in May, the fourth in June, and the last later. The Names.

Some have taken these to be kindes of Ialmines, and that therefore the Arabians Sambac, doth as firly agree to thefe as to the lasmines, for Cesalpinus taketh the first, which Matthiolus called Lilac, and so divers others after him, to be the lasminum caruleum Mauritanorum, or the Lignstrum Orientale (neither of which it can be, for the Ciprus Plini, as I have thewed you before, may most fitly be called by that name, and the blew I as mine is as I said very probable to be the third, which we call the Persian Iasmine) Clusius, Camerarius and others, call it Syringa cerulea, and Lobel and others Syringa cerulea Lusitanica, it is thought that Bellonius understandeth this plant, where he faith that the Turker have a shrub with Ivy leaves alwayes greene, bearing violet blew flowers on a long spiked stalke many together, of the bignesse and fashion of a Foxetale, and thereupon called Foxetale in their tongue, yet this of ours beareth not greene leaves in Winter, as Bellonius faith.lib.3, c. 50. that doth, whether it doe therein differ from ours, or whether he be miltaken, it resteth doubtfull. Some as Lugdunenfis faith, have taken this plant to be the Oftrys or Oftrys, of Theophraftus, because it beareth small seede like unto Barley, and some would have the white Syrings here set forth, to be his Oftrys likewise for the same cause, but I have showed you the true Oftrys Theorhraft before, as Clusius hath sufficiently declared it. The second is remembred in no Authour

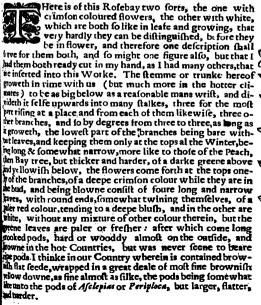

but the hortus Eystetenfis. The third is called by Profer Alpinus, in his Booke de plantie exoticis Lightrum nigrates by which name it came first to Banhinun, as he faith, out of Italy, and afterwards from Signiour Contarenthis Gatden, by the name of Syringa laciniatin folis, which he altereth to Ligustrum laciniatin folis, but it seemeth he had but onely a branch to fee, without flower, as it is in his description, and therefore could not further determine uponit, but I have often feene it both in and out of flower, and doe here give you both a full and true description of the plant, and the name that both we and Iacobus Cornnius fet it out by, in his Booke of Canada plants, vie. Agemilag Perfarum, which as he faith fignifieth Lilac Perficum, Agemenim Perfident fignificat, & Lilac florem, but ame to us by the name of Iasminum Persicum, because many of the leaves are formed very like those of Iasminum Catolonicum, as I have shewed you in the description, yet the truest name to be imposed on it, 18 Lilac Perficum, as I have before shewed you, and this is that Lilac laciniatis foliy, that J gave you understanding of in my former Booke. The fourth is called Frutex coronarius by Clnsius, and Syringa alba by all other Authours but Lobel, who alkth it Syringa Italica, not that he ever faw it growing naturally wilde in Italy, but that he there found it very frequent in their Gardens, Banhinus calleth it Syringa alba five Phyladelphus Atheneis. The last is called Sambac Arabum five I afminum ex Gine, fo that it may not unfilly be referred to either, it is called Syringa Italica flore albo slene, by Bester, who let out the great Garden of the Bishop of Exstor, although Banking sceme to make two formofit, as his custome is in many other things, which it is likely he never saw, but upon Alpinus his retembling the leaves unto those of the Orenge tree, for thereby he maketh his distinction. We may call it in English, either medouble white Syringa or Pipe tree, or the double white Iasmine, according as it is in Latine, which you will. although the fingle white hath nothing the like refemblance in the flower to a lasmine. The Vertnes.

There is no use of any of these in Physicke, that I know, and are but as grnaments in a Garden, and for the beinty and fweetenesse of the flowers there cherished, unlesse any would make a persume of the flowers, by infuling them in the Sunne with oyle of sweete Almonds, or draw a Chymicall oyle out from the said flowers, wdiltillation, onely the last Alpinus sheweth the Egyptians doe use more for ornament to trimme up and perfume memicives, then for to helpe them in their discates, neverthelesse, they make faith he an oyle thereof, which their women use in their bathings to mollifie the hardnesseand warme the coldnesse of the mother, for by their enerience they have found it to be very helpefull for hard kernels and tumours in the flesh, and to canse a more elicand (peedy delivery in travaile of childbirth by drinking this cyle warme and annoynting the wombe also Someofe likewife to drinke that oyle warme, and to annoint the stomacke outwardly therewith, against the cough and shortnessee of breath, and against the dangerous pleuriste, where one can hardly bring up the slegme, or their spittle, and against Impostumations in the lungs, and against the violent paines in the stomacke, bowels, or nivities: the oyle is made after the manner aforefaid, either with oyle of Almonds or Sefamum, and the flowers fleeped and funned.

CHAP. LIII.

1. Oleander five Laurus Rofea. The Role pay or Oleander.

1. Oleander flore rubro. The Role bay with red flowers.

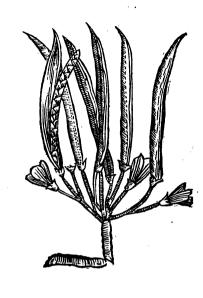

1. Oleander flore albo.
The Rose bay with white flowers.

2. Nerij facte arbor Indian. An Oleander-like Indian tree;

2. Nery facie arbor Indica. An Indian Oleander-like tree?

Because Lobel onely hath set forth this branch comparing it to the Oleander, I thought good to joywe it next thereunto, although wee have no further knowledge thereof then his relation which is thus. Seven or nice of these together like unto sheathes of leather, a soate, or a foote and a halfe long, every one of them resembling a slender Lamprey, did hang downe from one place of the branch, which was like a pithy Marsh Elder knotty pale browne sticke, so nearely resembling the cast skin of a Snake, or the dead body it selfe, that it might very well bright children therewith, although stuffed on the inside with woolly skins, at the same knot with these skins came forth some flowers growing out of small huskes, as the figure expressed them unto you.

The Flace and Time.

The first with red flowers groweth in Greece, Spaine, Italy, &c. in many places but that with white in no place but Candy, that we can heare of, and flower in Inly, the other is an unknowne stranger.

The Names.

The Names.

It is called in Greeke Nieson, if Podistroleer, if Nerium, and Rhododaphne by Camerarius. The last is so in Latine by most Authours, but Laurus Rosea by Apuleius and Lobel, and Rhododaphne by Camerarius. The last is so entituded and desciphered as I here set it downe.

We have nothing to relate of the last, but of the Rose bay, Dioscorides saith it is death to Mules, Dogs, Asses, and many other source sources and flowers, being taken in Wine, but Galenosto, simplicium, seemeth contrary hereunto, saying that outwardly applyed, it hath a digesting property, but inwardly taken it is deadly, both to man and all sorts of cattle, wardly applyed, it hath a digesting property, but inwardly taken it is deadly, both to man and all sorts of cattle, Matthiolus therefore to reconcile these two sayings, finely defineth Dioscorides, to understand such men as are Matthiolus therefore to reconcile these two sayings, finely defineth Dioscorides, to understand such men as are stitch Avicen, doth helpe those that are bitten by a mad dogge, and Enphorbium by the Scorpiom, and so likewise saith Avicen, doth helpe those that are bitten by a mad dogge, and Enphorbium by the Scorpiom, and so likewise divers other dangerous or deadly medicines, resist the venome of other things: But sortion would interpret another way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that is, that taken inwardly it was poyson, but outwardly applyed it did resist it, and saith moreother way, that it is dead in the saith moreother way, that it is dead in the saith moreother way, that is, and saith moreother way, that is

CHAP. LIV.

Cytisim. Tree Trefoile.

Aving in the last Chapter shewed you a Trefolle Insinine, which some as I said, take to be a Cytisus, a thinke it not amisse to set downe the kindes of Cytisus, next unto it, and because there is such diversity among them, I would distinguish them into two sorts, that is, into the right Cytisus, and those that come neerest unto it: and into a bastard kinde, that is some that are very unlike in many things, although like in some, and others like in many yet unlike in some that are very unlike in their taste and white aesse in their leaves and stalkes, declaring their nightestse unto the true sort: their blackesses and bitternesses, to the bastard kindes: of the first we will speake in this Chapter, and of the other in the

1. Greifus Galemicreditus, Maranshe Cornutus. The supposed true Cytifus or horned tree Tresoile.

This Cytifus (as Galemiaith groweth to the height of the Myrtle, or as Pissy, Columella, and Straboto, to the heighth of a meane tree) which many tooke as Lugdunensis faith, for no other then the Medica Lunara, and is yet essented by Befler, as it grew in the Bishop of Eystor his Carden (to be in some fort answerable to what Masthiolus settle forth of it, for acknowledging his former errour, in militaking the Trisoinus cabadiinum to be Cytifus, and sinding in Galem Cytifus was a shrub and not an herbe, he sheweth this plant, which he received from Cornulus the right, and therefore could be no Medica, which is a small creeping herbe, as all the forts are) and growth be two cubits high, covered with a grayish or ash-coloured barke, the wood whereof is sirme and hard the leaves are hoary white, as is the whole shrub, and grow without order three together on long scotestalks: the showers are of a gold yellow shining colour like unto Broome: the seede groweth in broad crooked cods.

This Candy plantrifeth up to above a mans height, that is, foure or five cubits growing writhed or crooked, and dithe thicknesse of ones arme, covered with an ash-coloured barke, the leaves are gray or white, longer and narmower then the former, and grow not alwayes three, but sometimes soure or five, upon a long sootestale, the sower grow at the ends of the branches, in a tust together like unto those of the Medow Tretoile, or common three leaved grasse, of a gold red colour, and greater then they: in the middle of each flower stand many slives white shining three sass sine as haires, set in grayish huskes, wherein the seed is enclosed afterwards, which is like another Trefoile likewise: the wood is very firme and massie, and of the colour of blacke Ebony, from whence showing Belli, did call it so.

This Germane Cysism should be contained from the roote sundry stender hoary tree Trefoile.

This Germane Cysism should be shou

forts or Broome flowers, standing many together one above another at the end of the branches, after which follow hairy, and somewhat hoary, little long, narrow and fat cods, containing therein small seed like broome, talting like a Vetch: the roote is wooddy, dispersing it selfe under ground divers wayes.

4. Cytism Hispanicus arboreus. The Spanist tree Cytism, or tree Trefoile.

The Spanish tree Cyrists, or the Tretone. This Cytifus rifethup with one stemme usually, covered with a darke grayish barke to the height of a man, saith Classim in Spaine, but higher with us, spreading sundry short braches all about, whereon are small pale greenish Trefoile laves, on the upper side, and set with a little reddish hairy-asses underneath, the yellow flowers are somewhat longer then others, and come forth at the soore of the leaves, in sundry places, usually two or three at a place, which were into small short and flat cods, lesser their Broome cods, and somewhat blackish when they are ripe containing small shr and blackish seed within them as small as Broome seed, as we have observed them, although Classim saith hee saw

5. Cytisu incanus major folys pinnatis sve quinti species altera Clusis. The great hairy tree Trefoile.

This groweth greater and more upright then the third by much, whose branches also are thicker and more hairy: the kaves are twise as big, the flowers of a deeper gold yellow colour and the cods larger.

6. Cytifu Hispanicu incanu sve sextus Glusij. Thelow Spanish hoary Cytifus.

The shootes of this Cytifus are not above halfe a yard long, slender and hoary, whose Trefoile leaves on them have the two lowest smaller then the middlemost, which is twife along, but of an hoary ash-colour, standing on short sootellakes, of an astringent drying taste, the slowers stand with

The supposed true Cytifus or tree Trefoile:

2. Cytifus Creticus ineanus five Ebenus Cretica Belli.
Gandy tree Trefoile or Candy Fhony.

4 Cytifus Hiffanicus arboreus.
The Spanish tree Cytifus or tree Trefoile.

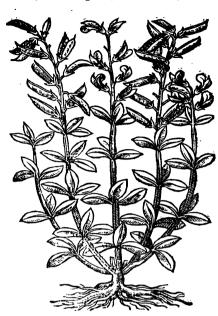

6. Cytifm Hiffaniem fextus Clufij.
The low Spanish boary Cistus.

7. Cytifus Auftriacus five feptimus clufij.
The Austrian or Hungarian low Cytifus.

10. Cytifus offavus Gerardi, Gerard his eighth Cytifus:

the leaves at the joynts all along the branches, two or three together fultained by foft hoary white huskes, wherein they fland, why Gerard should call this kinde femper wirem, and his Corrector after him so to let it passe, I know not, for neither Clustum first fet it forth, not any since him that have written of its, have so related it.

7. Crisim Austriacus sive sprimm Cluss. The Austrian or Hungarian low Cytists.

The slender lithy twigges of this Cytisus are pliable and hard to be broken, lying on or neare the ground, which are bare of leaves, unto the branches whereon they stand without order upon long footestalkes, shorter and greener then those of the third or Germane sort, and more hairy, greenish above and gray underneath: the flowers grow two or three at a joynt as the last and at the ends of the branches allo, yellow at the first, but before they are quite past, turne more gold yellow, so deepe that they seeme red withall: the cods are small star and hairy, with small browne seede within them.

8. Cycifm Pannonicm free septimi species altera Clusii The hoary low Cistus.

This is somewhat like the last in the stender pliable twigs, leaning downe to the ground and seaves like them: the flowers also are like unto them, but stand some or five together, at the ends of the branches, and not at the joynts as in the last: the cods and seedediffer not there-from, but the leaves are a little hoary, and so are the cods

9. Cytifus albicans Alpinus. The whitish mountaine Cytisus.

There is little difference in this, as by the notes thereof appeareth from others in the branches or leaves, but that at some places two or three tresoile leaves, are set at a joynt, and the slowers are paler.

10. Cytisus offerend. General his eighth Cytisus.

Gerard and his Corrector after him, mention this Cytifus as taken from Lobel and Pena, when as it agreeth with mither of those that are extant in their Adversaria, neither doth Banbinus quote him for it, as he doth all others that beknew; for the eighth of Tabermontanus, which might teeme to be this, Banbinus noteth to be his hir sure: the thiefest difference therein as Gerard saith, is in the leaves, which are a little dented on the edges, which yet

The Place and Time.

The first of these Baribolmens Maranta found in Naples, and Honorius Bellus in Candy, as he did the second is also all the rest, except the fixth and last were found by Clustus in Hungary, Austria, and the parts thereabout a they all slower in the Spring of the yeare, but some earlier and some later, and give their seede in August and September.

The Names.

It is called in Greeke xunss;, and Cytism in Latine, a Cythnio infula, as Pliny faith, from whence it was carryed to the Cyclades, to the Greekes, and after to the Latines, for the wonderfull fruitfullnesse it products both in men and cattle, but of pecially in their heards and slockes: the former times as Matthiolism and Tragus show by their K k k k k k

mistakings

1474

miltakings of the true Cysism, were smally verst in the knowledge of plants, in shet hat the most part, whatlover herbe offered it selte next to hand, that had but some shew like the crue, is was presently accepted to true, although after upon better examination it proved farre short thereof. The first of these is the Cysism Maranha of Marshielus, Lobel, Lugdanensis, and all others, and taken by Camerarism and others, to be the Cysism verm of Galess, Dissordes, &c., the Italian Pona, confounded this and the next together, as Belim seemed to doe alloin calling it Cysism Creticus, which he said is like unto that of Maranha, yea it is the same as he thought, having the like crooked cods, to be the Ebensa Creticus, but he afterwards corrected himselfle, in that it different muchia the heads of slowers and seede, from that of Maranha, but Bashimus saith, he received from Belim branches of each of these to shew the difference, so that this first is the Liguum Rhadium, or Cysism verm. And the second is that which he first called Cysism Creticus, and by the Cretanes Archimenoxylum, that is, nobile signum, which so distinctions sake he callet beense Creticus. The third is the first Cysism of Clussus in his histery, and the Cysism prior of Lobel, and likewise the Cytism albus sylvestria of Cordus in his History, although Bandium doth sever them into three forts, as who so will heedefully marke them, shall soone see that there is no such distrence in them, to cause them so to be severed. The fourth is the third Cysism of Clussus, which Lobel and Lugdunensis call quartus Hispanicus, because it is so in his Spanish Observations, but we take them all in this worke, according to the numbers expressed in his History of plants, as I have shewed you in divers places before. The fourt last on their titles, the number that you shall since them in Clussus.

The leaves of all these forts (for it is probable they doe not one differ from another) are cooling, and doe diperse tumours, and hard swellings, if they shall be beaten with bread and so applyed, the decoction of thembeing drunke, provoketh urine, for as Galen saith, the leaves have a digesting quality, with some temperate hamidity in them also, as Mallow leaves have, Columella sheweth that in former ages, there was much profit made by the feeding of sheep herewith to give store of milke, and not onely to fatten them, but Bullockes and Goateral-so, and Hens, and all other forts of cattell: but was planted also for Bees to seede on, as from whence they did gather more honey, then from any other plant whatsoever, and besides it abideth greene eight moneths of the yeare for their palture, and may be kept dry therest of the yeare following, as the dry sodder: if women that be Nurses have not any store of milke in their bross, let them steepe some of the leaves and young branches hereof in faire water all night, and being strained forth in the morning let them take three parts thereof, with a sourch of wine, which will breede good store of milke in them, and make their children strong and able: the dryed leaves steeped all night in water, and boyled afterwards, strained and drunke is as effectual as the juyce.

CHAP. LV.

Pseudocytism. The bastard or base tree Tresoile.

Here are divers forts also of this base or bastard kinde to shew you, whereof one is the most adulterate T of them all, which therefore shall be last exprest.

1. Pseudocytism Hispanicus primus. The first Spanist base tree Trefoile.

This first base tree Trefoile groweth up to the height of a small tree, whose body and branches are covered with a grayish barke, the younger twigges being hoary white, the leaves are many, and smaller then in any other fort of Cytisus, three alwayes set on a stalke, of a pale greene colour, and abiding in the Winter, contrary to any of the rest, of a bitterish taste, the flowers are yellower and smaller then Broome flowers, standing as it were spike sassion at the end of the branches, after which come rough hairy long pods, wherein is thicke flattish blacke seede. Smaller then that of Broome: the roote is wooddy and spreadeth divers wayes, the wood is firme and yellowish.

This second Spanish fort, riseth not much above a yard high, full of shootes from the rootes, which are branched forth and wholly white, having hoary Tresoile leaves, never open but as it were folded together, the middle rib being great, of an extreame bitter taste: the deepe yellow flowers, are somewhat sweete and stand at the end of the branches like the former and the peds that follow are long and rough, of a blackish purple colour, the points being turned downewards, with greater and blacker seede in them: the roote is like the former.

3. Pseudocytisus miger. Blacke base tree Trefoile.

This base tree Trefoile groweth with the limber pliant shootes, it bringeth forth not so high, but straighter and greater then the last, the barke of them being of a darke grayish colour, beset with small Trefoile leaves, somewhat round, and a little bitter in taste, and of a darke greenish colour, the flowers grow at the toppes of the shalkes many together spike sashion, of a yellow colour and pretty sweets sent, like unto honey, the cods that solour are somewhat long and star, with brownish seeds in them.

4. Pfeudocytifus folis; fubrossadis. Base tree Trefoile with roundish leaves.

The stem hereof hath sundry branches growing forth from it, and set with small roundish darke greene leaves, upon very short footestalkes: the slowers, are smaller then those of Broome, and yellow, but more slore set together at the ends of the branches, then the smallness of the plant might seeme to beare, of a pretty sweete sent, and a pulselike taste, the pode and seede are small like the last.

This Spanish base tree Tresoile hath hard round striped stalkes, foure or five some high, branched into sundry branches, somewhat woolly, stored with divers small Tresoile leaves, of a pale greene colour, the flowers are small and yellow like the others, unto which succeede many small pods like unto those of Birda-soote, three, soure, or five joyned together on a stalke, with small shat blackish feede in them: this is not the same with the first of these are tree Tresoiles here for downed being much different.

base tree Trefoiles here fet downe being much different.
6. Cytisus facie quibusdam Alissum fraticans. A Cytisus-like unlike plant.
Because others before me have placed this plant as last of the Cytisus, so must I for this time, which else might

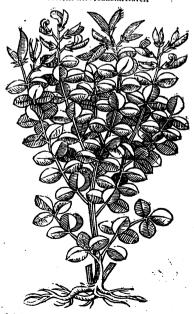

3. P/cudicytifus Hillanteus primas. The first spanish bale tree Trefoile. 2. Pfendosytifus Hilpanicus ferundus. The fecond Spanish base tree Trefoile.

4. Pfeudetytifus foligs fub otandis Bafe tree Trefoile with roundith leaves.

Kkkkkk 2

in some fort have beene set with the other Alysa, the description whereof is thus. From a tough wooddy rootes grow up fundry pliant hoary greene stalkes, spreading into branches let with divers hoary greene leaves together, contrary to all the other Cytife's, yet each leafe by it selfe, somewhat like unto them, but thicker and hairy alfo, the flowers are many and yellow, that fland at the toppes, fpike fathion, composed of foure leaves like to Stocke Gilloflowers, after which come feedes in round pods. The Place and Time

Three of these grow in Spaine, the former two found by (lugue, and the last by some other, the other two in France and Germany, and flower and seede in the time of the for-

The Names.

The first of these is the first Cytisus of Clusius, which Lobel and Lugdanensis call Cytisu Hispanicus primus, by Dodo-neus Pseudocytisus prior, and Baubinus Cytisus minoribus foliya ramulia tenellia ville fir. The second is Clufium his second Cy-Lugdmeng, and by Dodonem Pseudocysisus alter. The third is the Pseudocysisus seu niger Cordi, the Cysisus niger five major of Camerarius. The tourth Cytisus of Clusius, the Cytifus miner of Gefner, which Lugdunenfis calleth Cytifus Gefnere, and by Banhinns Cytifm glaber nigricans. The fourth is the Cytifus alter minor of Lobel, which Eystetensis calleth Trifolium arborescens. The last Bauhinus onely hath described in his Prodromus, by the same title I doe here give it you.

The Vertues.

We have nothing recorded of any particular, any of these base shrubbes are indued withall, and although some may thinke, that they are of the same quality with the former. I am not of that opinion, in regard they are all much more bitter then the former, and some intensively bitter, which can be no helpe to encrease milke, in any creature, nor yet to fatten them as the former doc.

6. Gytifus fane quibufdam Aliffum fruicans,
A Cycifus-like qubite plant.

CHAP. LVI.

Cupressus. The Cypresse tree.

Ome doe make two forts of Cipresse trees, the male and the female, the one that spreadeth more then the other, which groweth more upright, not much differing in any thing elle, which maketh me thinke the divertity rifeth from the foyle or fome calualty, and that the male which spreadeth is not a diltinct species, which preserveth the kinde naturally as all other things doe, especially seeing as Theophrosius saith, the one doth degenerate into the other, and that both doe beare nuts

and feede alike. I shall therefore under one mike mention of both sorts, if they be so, and shew you that the Cypresse groweth to be a great tall upright tree spreading out the branches so even round about, that it seemeth to be fo formed by Art, being small below, not farre above the ground, then spreading out larger, yet keeping a round close compasse and afterwards spiring up to the toppe, lesse and lesse, very well representing a Pirami or Spire Reeple, the body and armes are covered with a reddish barke, the leaves are ever green, but looking much of the verdure in Winter, which it regaineth the next Spring after, and somewhat long, slender, and flattish round, parted very much and somewhat resembling Savine, of a resinous sent and strong taste: some trees are seene in some places to be more spreading in their branches, and not abiding so close, especially when they grow old, and doe beare their small yellow flowers, and their fruite, or nuts, as they are called afterwards, which grow here and there among the boughs, loven or opening into divers parts growing ripe, but close and hard while they are young, of a ruffet browne colour, wherein are contained small brownish seede, but not so small as motes in the Sunne, as Matthiolus and others make them to be : the roote spreadeth much, but not very deepe t the wood is reddish, very firme and durable, not subject to corruption or wormes, but defending all other things, by the ftrong heady fent it hath, from all mothes and wormes, it yeeldeth out of the body of the tree, a kinde of liquid Rossen, like unto that of the Larche and Turpentine trees, of a very quicke and sharpe talle.

2. Cupressus Americana. The Cipresse tree of America. Although I doe not take this to be a true Cipresse tree, yet because it hath obtained that name by all our travellers into the hether or Northerne parts of America, where it is found in fundry Countries thereof, let me joyne it here untill by a better regard I may place it in a fitter. It groweth in some places to be a very goodly tall tree, fifty fixty, yea eighty foote high, without any branch, and neere three fathome compasse at the lower end, and then spreadeth sundry large armes and branches, beset with many winged leaves, which are very fine, small, fmooth, plaine, and not square, crumpled or plaited as the true Cipresse is, and somewhat longer also, set on both fides of the stalkes, without any certaine order, being not alwaies opposite: the nuts are somewhat like those of the Cipresse but greater, with thicker, more open scales and greater seede within them. The wood smelleth somewhat sweete, which in part caused it to be termed a Cipresse. Whether this should be that Thuja, of Theophram.lib. 8.c. 15. that is both in stocke, branches, leaves, and fulle, 10.0.1) that is south in thorse, branches, leaves, and hutelike unto the wild Cipreffe, it were formewhat worthy tobe scanned, whose fruite it is likely, is that Habbel, that Faludanns brought home with him in his returne from his myailes, and faid it was so called in the East Countries, the figre, wherof I here give you with this branch: the nut it selfe and much resemble the nut of this, both for forme and large thickenesse of the scales. This looseth his leaves in Winter.

The Plice and Time. The ordinary Cypresse tree, groweth in sundry of the wirme Countries, of the Levant, I altwards, and in many ofthe Isles likewise in the Mediterranean Sea, as Abodes, and Candy, where it is so familiar to the soile, that it springthup every where, of it owne accord, in the Mountaines Me, and Leuce, if the ground be stirred a little, and that whing elfe be fowne thereon, and beareth ripe fruite from toumber, almost all the Winter. The other is as is faid. infundry Countries of the North America, whose seede was brought by Master Tradescant from Virginia, and fown bere, doe ipring very bravely.

The Names.

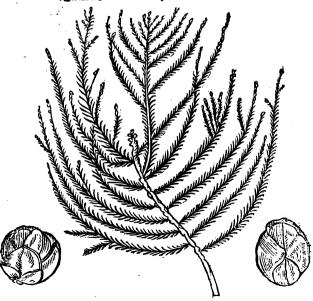

It is called in Greeke wo mieril & and wo mierous sand wien maeis miti desembras, ideft, a partu parilium ramorum, in Latine inesses, and Cupresses also. The Arabians call it Saro, and Seru, the Italians Cypress, the Spaniards El Cypres, the French, Dutch, and English, Cypres, and the Germanes Cypressen.

The Vertues. The Cypresse cooleth, bindeth, and dryeth without either hate or biting tharpeneffe, but to much as may put the aarbity in action, yet it doth resolve and consume humidines, in putride ulcers, the pouther of the leaves with a little Myrrhe and wine, helpeth those fluxes that fall on the bladder, and provoketh urine being stopped, and without

Myrthe the fluxes also of the belly or flomacke, bleedings, and fpittings of blood: the decoction of them, performeth the same likewife, it helpeth also the cough, and shortnesse of breath, by taking filling a small draught, and if the likedraught be taken every moraing for many daies together, it will helpe the rupture, to as fome of the fresh leaves be applyed also wthe place, and well bound on : which things the nuts do performe moreeff. Aually, and in all fluxes oblood and humours: the imail thips or rasping of the wood, taknin Wine provoketh womens courses, and helpeth the biting of the Scorpion, as also procureth a mod colour to the whole body: theleaves bruifed and laid unto heh wounds that bleede much, doth flanch the bleeding, and fo cololidateth the wound being uled by themselves, or with fine Barley meale, it helpeth Saint Anthonies fire, creeping ulcers, and urbancles and the fores and ulcers of the privy parts in man or womm, and helpeth the inflammatiomofthe eyes, and applyed with crote to the stomackedoth much omfort and strengthen it against diags, and other the passions hereof upon defluxions of tharpe I. Cupreffus major fre fativus, The Cyprelle tree.

2. Cupressus Americana, an Thuja Theophrafti Cupresso fimilis, cu, ci f. ullus Habbel buc a // indatur. The American, or Virginia Cyprette ruich the fruite Habbel of Clufius which is like unto this.

Kkkkkk 3

humours

1478 CHAP.57. TRIBE 16.

humours thereon, the leaves beaten with some dry figges, doe mollifie the hardnesse of temours, and of the testicles, and confumeth the Polypus of the noise, which is an excretience or peece of flesh growing therein: the fame allo boyled in vinegar and made up with the meale of Lupines, cauleth rugged nailes to fall away, and helpeth the tooth ache, the mouth being often washed therewith the same also taketh away the Morphew, freekles, spots, and the like in the skinne, the nuts boyled in Wine, and the haire washed therewith, canieth them to grow black, and the like in the skinne, the nuts of the pourter of a Mules hoofe, and oyle of Myrtles, it will flay the falling of them: the branches and nuts of the Cypresse being burned, driveth away gnate, and other such like troublesome slyes: the leaves being laid among seedes of any fort, will keepe them from being eaten with wormes, and the wood in Wardrobes will preserve garments from Mothes: the wood it selfe is in no age subject to the worme, moud in we are roces will preserve garment and therefore thuch defired in chefts and boxes, There's reported that he saw at Damiate in Egypt, a Cypresse chest that was digged ten foote deepe out of a moorish ground, and found uncorrupt in any part, which as was likely had lyen there fince Sultan Selim jubdued Egypt in the yeare 1512.

CHAP. LVII.

Arbor Vite. The tree of life.

His tree being in some fort like unto the Cypresse, I thought good to joyne next thereunto. It is feth to be a reasonable great and tall tree, standing long in a place, covered with a darke reddish barke on the body, but more red on the branches, foreading many branches, and many small ewigges bending downewards, which and the long leaves, that come from them, on both fides are flat, and plaited or braided, as it were like a braided lace, of a darke yellowish greene colour, soft and not hard or pricking, abiding greene, alwayes smelling without falling away, and tasting somewhat strong and resinous,

not pleasing to many, but ready to provoke casting, yet very cordiall, and pectorall also to them that can endure it, at the ends of the branches come forth small mossie vellowish flowers, which turne into small scaly yellowish heads, wherein lie small and long brownish seede: the wood is firme and hard, and of a brownith colour.

The Place and Time.

It first was brought from Canada by the French, in King Francis the first his time, and presented to him, and from the encrease thereof, is spread sufficiently through all the Countries neere it, and flowreth in Aprill, and May, and the fruite isripe in August and September.

The Names.

This being a new found tree, hath no true, suncient Greeke or Latine name to call it by, for although most that have written of it, referre it to the Thuja of Theophrastus, lib. 5.c. 5. which he comparesh both in branches leaves and fruite, unto the Cipresse tree, yet Omne smile non eft idem, and although it hath some likenesse in the leaves, yet so it is not in the fruite, and I verily beleeve, that it is proprium /ui genus, not to be parallelled, or made the same with any other we have, as most of the trees and herbes of America, are not equall to those that grow in Europe, the hether part of Africa and of Asia the leffe, as experience heweth. Lugdmensis maketh it to be his Thuye tertium genus. Some would make it a kinde of Cedrus Lycia, but that beareth red berries, which this doth not. Some also have called it Arbor Paradifen: but it was presented to the French King by the name of Arbor Vita, but upon what reafon or ground I know not, but ever fince it hath continued that name of the tree of life. Clasism and Bun-

Arbor Vite. The tree of life.

binus fay, that fome would referre it to the Bruta arbor Pliny, but that as he faith hath whitish branches, and fweete being burned. The Verties.

Although we have no forraigne experience to reportunto you, yet upon tryall of the leaves by some in our owne Land, we have found that they that were long time troubled with a purulentous cough, and (hortneffe of breath, have been much releived and holpen thereof, by the use of the leaves taken falling with some bread and holpen thereof, butter, as the most familiar way for some few dayes together, thereby expectorating the flegme studing the lungs, and so clearing the passes, as they found much good by it, and doubtlesse the resinous smell and taste, abiding dryed as well as fresh, dothevidently declare the tenuity of parts therein, and a digesting and clenting quality, which If any would put into action they should soone see the effect.

CRAP. LVIII.

Have three or foure forts of Tamariske, to bring to your confideration, one whereof was never published or made knowne to the world, before I gave you a hint thereof in my former Booke, which I meane to ranke with the reft here.

1. Tamarifem folio latiore. The Gamarian The broader lateral.

Me observed it growne in some places where it hath stood very many yeares to be a reasonable great tree, whose whe was somewhat thicke and rugged, of a darke reddish colour, the younger shortes being reddish at the first, which was somewhat tanks and sugged, or a darke reddish colour, the younger showes being reddish at the first generaliter, and blackish when they are dry, befet all about with fine long darke greene leaves, as it were erned because they are so small and short, that stand bout the longer, yet are they greater and broad the longer, yet are they greater and broad then the French kinde: at the end of the Tamariske of three longs.

Tamariske of three longs.

ping shootes come forth a long spike of flow-mand leaves among them, each flower being mide of five purplish leaves like threds, divers of them standing in a greene huske together, in which huskes when the flowers are palt, grow delving among them, which together are anyed away with the winde : the leaves fall amy every Autumne, and fpring anew in the Spring.

2. Tamariscus folys albidis. White Tamariske.

Of this kinde I have seene another fort very bearifull and rate, brought me by Mafter Wilham Ward, the Kings chiefe fervant in his Gramy, from his house at Boram in Essex, whose banches were all red, while they were young, mall the leaves white, abiding so all the Summer, without changing into any skew of gt ene like the other, and so abideth conflantly years aftor years, yet fliedding the leaves in Winter like the other.

Tamurifen fello tenniore. The French or finer leated Tamari ke.

This finer leafed Tamariske doth in many placagrow but into a small shrubbe also, but in others into a great thicke and tall tree, with many fpreading armes and branches, whose leaves at fet in the same manner, and grow after the same fashion, but finer and imaller like unto Heath, of a grayish greene colour: the flowers are smalbrand grow spike fashion like the other, being purplish at the fift, tut white when they are blowne open, consisting of five leaves apeece, which turne into downe with the fmall feede in them, and falleth away as the Willow and Poplardoe, but Lobel faith, they turne not into

downe, but the fruite is round like Ollive stones, which as he saith being laid in the Sunne have stirred to and fro for three dayes tog: ther, having a worme within them, which was the chiefe cause of the motion, and having made a hole in the graine commeth forth : which of these is truelt, seeing both affirme the matter as eye-witneffes of the relation, I know not, never having seene the tree beare out his fruite or feede with us.

4. Tamariscus Agyptia galler ferens. The Egiptian Tamariske.

This tree groweth in Egipt and other places of Spria, Arabia, and Turkie, as Bellonius faith, who observed it to hea wondrous great and high tree, growing as well in dry ground as in moilt, whole woods of them growing together in each foile, whole kind is of this last described, but besides, it beareth small hard excressences, like unto great Gaules, of divers formes, some longer, some shorter, some broad, others thicke or stender. The Place and Time.

The first groweth naturally in Germany, in divers places, and as Cordus saith, he observed two forts, one growing neere the River of Rhine With a finer leafe, and firmer wood, and a little pith, and another about the Danubius or Description : The third growethnot onely in Narbone, and about Mompelier, but in Spaine in divers places, as Clufius setteth it downe: the last in Arabia, Egypt, and the places neere thereabouts, they flower about the end of May, or in Inne, and the feed is ripe and blowne away in the biginning of September.

It is called in Grecke uvein in Latine also Myrica, and Tamarix, but of divers Tamarifeus, and by Pliny Bria Ilvestrie in Achaia as Lugdunensis saith. The first is called Tamarifens, and Tamarix humilis by Cordus and others,

and Tamarifeus Germanica by Lobe!, all others call it Myrica or Tamoriz Sylvestris or altera. The second hath and Tamarican Germanica by Love!, all others call at evaprison of A answers of Tamarix Narbonenfir by Lovel, Lugno other name, but what I have given it. The third is called Tamarifem or Tamarix Narbonenfir by Lovel, Lugdunensis, and others, and Myrica, and Tamarifem sylvestrie by Clusius and Alpinus, and Tamarix Gallica ant Hilpanica by Clusius also: The last is taken to be the Myrica, and Tamarix sativa of Diescorides, by Clusius, Cordus and others, by Bellonius Tamarix gallis anusta. The Arabians call it Chermasel, and the former sort Tarsa or Carsa, the Italians Tamarigio, the Spaniards Taray, and Tamargueira, the French Tamaris, the Germanes Tumarischen baum oderholtz, the Dutch Tamarschen, and we in English the Tamariske tree. The Vertues.

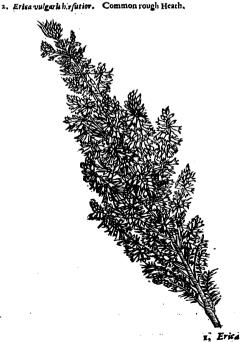

Tamariske as Galen laith, is of a clenting and cutting quality, without any manifelt drying, yet it hath a little therein, but the fruite and barke are much more drying, and is very powerfull against the hardnesse of the spleene, if the roote or leaves or young branches be boyled in Wine or vinegar, and drunke and applyed outwardly to the place also, the leaves boyled in Wine and drunk, is good to stay the bleeding of the hemorrhodiall veines, the soitting of blood, and womens too abounding courses, and helpeth the jaundise, and the chollick, and the bitings of the Spider Thalangium, the Viper and all other venemous Serpents, except the Afpe. The barke is as effectuall, or rather more to all the purposes aforesaid, and both it and the leaves boyled in Wine, and the mouth and teeth often Washed therewith, helpeth the tooth ache, being dropped into the cares easeth the paines, and is good for the rednes & watering of the eyes: the faid decoction with tome honey put thereto is good to ftay gangrenes, and fretting ulcers, the faid decoction is also good to wash those that are subject to lice and nits. The wood is held so powerfull to waste and consume the hardnesse of the spleene, that (although it is likely to be fabulous that is said thereof) if Swine drinke, or ease their wash out of the toughes made thereof, it will waste their spleene so much, as that they will be found quite without after a while, but it sheweth that is very effectuall to consume the spleene, and therefore to drinke out of cannes or cups made thereof, is very good for spleeneticke persons. The assess of the wood are used for all the aforesaid effects, and besides doth quickely helpe the blisters raised by burnings or scaldings of fire or water. Alpinus faith and Vestingius affirmeth it, that the Egyptians doe with as good successe use the wood hereof to cure the French disease, as others doe with Lignum Vite, or Guajacum, and give it also to fuch as are possest with lepry, scabbe, pust es, ulcers, or the like and is availeable also to helpe the dropsie, arising from the hardnesse and obstruction of the spleene as also Melancholly, and the blacke jaundise that ariseth thereof.

CHAP. LIX.

Erica. Heathe.

Here are a great many forts of Heathes, and therefore to avoid confusion I must devide them into foure Ranckes or Orders the first of those whose leaves are like Tamariske, the second like unto the Heathelow Pine or Coris: the third is of those that lye or leane downe to the ground, and the last of those that beare berries.

The Theater of Plants.

1. Erica vulgari. Common Heathe.

The Heath that groweth most frequent in our Land, is a low shrubby plant, little above halfe a yard or two tote high, with rough wooddy brownish stalkes and fundry branches, plentifully stored with small short greene leves like to those of Tamariske, four ensually set together, from the middle to the ends of the branches, stand full bottle like bright purplish flowers at severall distances about the stalkes, and ending in foure corners, in which grow finall stede when they are past the roote spreadeth deepe, sometimes this is found with white flow- Flore alba mbut very feldome.

2. Erica vulgaria hirsutior. Common rough Heath. This other Heath groweth like the former in all things, but fomewhat higher, the leaves whereof are alike alfo. more rough, and of a hoary greene almost white: the flowers also are like, but somewhat raler, and herein milleth the chiefelt difference: the rootes of both grow downe, and are strongly fastned in the earth: the feed like and fo is the roote.

3. Erica Graca Phana dieta. The Greekish common Heath. Bellonius in his first Booke of Observations, and the 53. Chapter, that giveth us the knowledge of this Heath, with, that meeting certaine boyes that had gathered bundles of Heath about Syderocapfa in Macedonia to burne, which they called Phana, was desirous to know the difference betweene it and common Heath, and by them klearned this, as one especiall note of difference, that it is easily pulled up by the rootes, without any instrument ndigge the ground, when as the other common fort cannot be gotten out without a spade to digge it.

The Place and Time. The first groweth throughout the Land in waste grounds that are called Heathes, because this kinde of plane noweth most plentifully thereon: the second groweth on Windfor Heath, where Clufius saith he found it, and the last in many places of Greece, the first and second are found sometimes twise slowring in the yeare usually, in lehand August, and fometimes in the Spring alfo. The Names.

The generall name for Heathe in Greeke is seein, but Tetralia by the Athenians as Pliny faith, in Latine Erica. The generall name for Heathe in Greeke is visite, but I estair by the Albeman as runy latin, in Latine wild form of for the feewed you in the third place adolfome Myrica, milkking it, yet by Parro Sifara, but that particular fort here shewed you in the third place it filled Phama now adayes by the Greekes. Marcellm was in a very great errour, that made Heath a kinde of mome, because it see vertex to the same use, that is, to sweepe houses. The first is by all called Erica vintgaria, and like Myrica folio by Lobel and Clusius who also so calleth the second, which Bambinus saith, some tooke to be the slago Plinig. The last is sufficiently expressed in the description, and here before. The Italians call it Erico, the Spainerds Queiro, the French Bruiere, the Germanes and the Ducch Heyden, and we Heath.

CHAP. LX.

I. Erica Coris folio maxima alba. The great white flowred Heathe.

His Heath groweth the greatest of any, even as tall as a man, and yet fometimes much lower, with wooddy browne stalkes and branches, the leaves being fmall round and fhort, formewhat like those of Coris, let in a quadripartite forme, or croffe fahion, the flowers likewise grow foure together at a space,

from the middle of the branches upwards, forming a very long spike of a foote long, and are like small long and hollow white bottles somewhat sweete, the seede and rootes are like the former kindes.

2. Erica Cornfolia maxima purpurascens.

The great purple flowred Heath. This differeth from the former in nothing, but in having knderer Ralkes, yet as high, and in the flowers, which are long and hollow like them, but of a purplish colour.

Another like hereunto Masshiolus fetteth forth with flowers

onely at the toppes of the branches.

. Erica major floribus ex berbaceo purpureis.

Greene Heath with purplift greene flowers.

This like wife different little from the last, but onely that it is lower and more largely spread, and hath darker green leaves, four fet together all along the branches, and flowers like wife up to the toppes in forme like them; but of a whitish greene Purple colour being fully growne.

4. Erica scoparia. Brush Heath.
The Brush Heath groweth close and round, with sundry Amder branches, and small greene leaves on them, which quickely fall away from the stalkes being a little dry, and the lowers two together for the most part, smaller then the former, and of an herby greene colour, but hollow as the other: bildes these, it likewise sometimes beareth small scaly heads ofleaves, like unto those of the common hard Time.

2. Erica Coris folia maxima purpurafiens. The great purple flowred Heath.

3. Ericamajor fleribmex berbacco purpureis. Great Heath with purplish greene flowers.

4. Erica Scoperia. Brufh Heath.

5. Ericaj umi'a Be'ga un Lebelt Sangaria noftras. The low Daten, or our Proome Heath.

6. Erica Scoparla altera.
Another Broome Heath.

7. Erica Carlo fallo quinta Ciufij.

5. Erica pamila Belgarum Lobely feoparia nostrae.

The low Duce or our Broome Heath.

This Heath groweth low and short, hard and brittle, with blacks and brownish branches, and small greene laves like those of Tyme set on them, somewhat hairy, but four together as in the rest, the slowers grow five or size together at the toppes of the branches, hollow like the reft, and of a ple purplish colour.

> 6. Erica scoparia altera. Another Broome Heath,

This other differeth not much from the laft, but in bearing mee leaves at a space, somewhat broader then the other, green sove and gray underneath, and a little hairy withall; the fowers likewise are many; and stand three together, at the topes by equall distances, turning all one way, being somewhat larger and greater believed, but of a deeper red colour ten the last.

7. Erica Coris folio quinta Clußi.

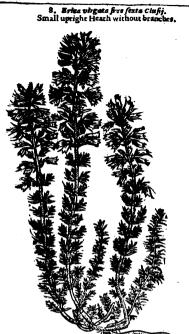

Clußiss his fifth Heath, with triple branches and léaves.

This triple Heath groweth low, and with flender branches, wite it the reacting rowers low, and with up inter orancies, three until fet at a joynt, and three small thinne leaves likewise fet by spaces thereon, in an even order or manner, the sowers grow from the middle to the top, somewhat large, many together at the joynts, upon longer footestalkes, and are of a full or dead purplish colour.

S. Erica virgata five fexta Clufij.

Small upright Heath, without branches.

This Heath hath fundry hard and upright stalkes rising from the roote, scarse a cubic high, being all single, without any branch spreading from them, and covered with an ath-eboured barke, at the severall joylats whereof come forth divers sall darke greene leaves bushing together, and towards the passing findry hollow flowers, like the rest standing together by pack, of a nost bright deepe crimen colour handler deeped. faces, of a most bright deepe crimson colour hanging downs,

9. Er ca similis peregrina planta Lobelij. Lobel his stranze Heath.

upon long footestalkes: you must understand that all these sorts beare small seede, although it is not mentioned to every one. 9. Erice similis perterina planta Lobely. Lobels strange Heath.

This strange plant (which Lobel could not tell what to make of, finding it growing in a pot, in Mounsieur de Brancion his Garden, yet would joyne it in the end of his Heathes, with this title as one of them, is a very strange Heath indeed, when as he made another plant that was very like it, to be a kinde of Sedam minimum vermiculature as in the same page, and the next line unto this, he himselfe doth fit it downe, yet calling it Erica peregrina altera being to neere one unto another that I thinkethem congeneres) groweth shrubby, that is, with wooddy stalkes and branches, like other Heathes, with many small long narrow leaves upon them, and purplish flowers at the toppes, confisting of foure small leaves apoece, as neere as my memory will serve me, faith Lobel.

The Place and Time. Cingun faith, that he found the first in fundry parts of Portugall, not farre from Listobone: the second in the fame places, but more plentifully, and in the Country of Narbone as Lobel faith. The third also about Liftbone, and the fourth both in Spaine, Portugall and Aquitaine, and Narbone also almost every where, it flowes there twite every yeare, both in the Spring and Fall. The fifth Cinsim saith he found, both in Brabane and Gelderland, and also in old Castile in Spaine, and Lobel saith in Flanders, and Brabant, but he might as well have said, on Hampfleed Heathe, and divers other Heathes in England: The fixth in Portugal alfo, and in our Land likewife. The leventh by Lifbbone allo. The eighth was seene by Classus as well in England about Windfor, in flower in September, as in old Gastile, and France. The last was not knowne to Lobel from whence it came to him that had it, neither can I fav more of it: They flower most of them in Inly and Angust; and yet some continue in flower longer, and some beginne sooner,

The Names. The first, second, third, and fourth here are of the same numbers with Clusium in his history of Plants, and Lobe! calleth the second Inniperifolia dense fruticans Narbonensis. The fifth is the thirteenth Erica Coris folio with Clusius. & with Lobel Erica pumila Belgaram, and the fifth Erica with Dodonaw. The fixth is Clufin his twelfth Erica Gorin folio, which Lobel calleth Erica Inniperifolia altera. The feventh is Clufing his fifth Erica coris folio, which Baubinus nameth Ericaternis per intervallaramulis. The eighth is Clufius his fixth Erica coris folio, which Lobel calleth Erica pumila caliculata unedonu flore. The last is entituled by Lobel as I said, Erica peregrina Brancionu.

CHAP. LXI.

1. Erica procumbem sive supina pallide purpurea. Pale purple creeping Heath.

His leaning Heath growerh up with many round browne Ralkes, of a foote long or more, leaning downe to the ground, and sometimes taking roote againe as they lye, about whom are set many long small leaves foure set together, and sometime five at a place, the flowers are of a pale purple colour, standing at the toppes of the branches like unto the other of this kinde, the feed that followeth in this as in most of the other, is small and blackish, the roote is hard and wooddy.

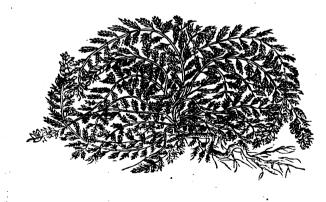

2. Erica supina herbacea. The greene flowred Heath. This Hearh hath low creeping Italkes, tearfe a foote high branched forth, and foure leaves at every place, fet

a crosse thereon, the flowers come forth among the leaves, towards the tops, being finalland hollow, with foure ends like the reft, but of an harby or greene colour : the feede is like the other.

2. Erica supina carnea. Blush coloured leaning Heath.

This low Heath groweth not higher then the last, but much more beautifull in that, although the stalkes be blackish and slender, leaning to and lying on the ground, and the leaves stand by three at every space all along the branches: yet the flowers that grow at the ends of them. are of a fine flesh colour, hollow like the rest, and ending in foure points with eight blackish threds within them, and a purplish pointell in the middle; this hath also small blackish seede,

4. Erica supina ma itima Anglica. Our English low Sea Hearh.

this is often found with leafy greene heads like those of Time.

4. Erica sapina marisima Anglica. Our English Sea low Heath.

This fine small Heath groweth low, but thicke set with stalkes and branches, and thereon very small follows. greene leaves up to the toppes where the flowers fland many together as in others, of an excellent purple colour, continuing long in flower and colour. 7 bs

The Theater of Plants. TRIBE 16.

The Place and Time. The first Classim found in Styria and Austria, upon the hills there, and so likewise the second, and the third in and flower at the time with the rest: The last was found by Lobel, about Porsmonth in our owner.

The first, (econd, and third, is the teventh, eighth, and ninth Erica Coris folio of Clasius, the last hath not beene The Names. mined by any before now, and by Lobel termed anguitifolia maritima Anglo britanica.

CHAP. LXII.

Erica baccifera fructu albo. White berryed Heathe.

He white berryed Heath rifethup with stalkes a cubit high distributed into branches, and both covered with a blacker barke then any of the rest, the leaves likewise that are set in a triple order at every place, are of a blacker greene colour, and of a little heating as well as binding raste is both similar to be been set of a blacker greene colour. brave shining or transparent white berries like almost unto darke pearles, at the toppes of the branches glofan acide juyce, and three hard graines or feede within them, what flowers it bore hath not beene as yet olerved. 2. Ericabacciferanigra. Blacke berryed Heath.

The branches of this Heathe, spread farre about upon the ground, and as they lye shoote forth rootes againe, hing up after a while, a great deale of roome, which a humber of triple leaves doe compafie, and fometimes sung up after a winte, a great deate of foothe, without a financial state first of a drying taste, and after somethat the peans of the flowers stand at the joyats with the leaves, towards the toppes, mailting of three leaves a peece, of a whitiful greene colour, with purplish threds within them, which turne womail blacke berries, like unto Iuniper berries, with a darke purplish juyce within them, and many trians glar graines or feed within them likewife. The Place and Time.

Cluftus faith he onely found the first not farre from Lishbone in Portugal, and the other on the Hills of Austria ad Sigria, and we may fay in England and Ireland also in many places, and flower at the same time with the ellor rather fomewhat later. The Names.

The first is called Ericabaccifera by Label, and Ericabaccifera tennifolia by Tabermontanue and Gerard, and is menth Erica coris folio of Clufius, Amatus Luftsanus tooke it to be the Acacalis of Diofeorides, Which the Pora

> 1. Erica baccifera fruelu albo. White berryed Heath.

tingals

LIIIII

ting als call I amarinhera, and the fruite I amarinhas. The second is the Erica baccifera of Matthiolim, which I bel, Lugdunenfis, and I balim call Erica baccifera Matthioli, and is the eleventh Erica coris felio of Clasim: but the is not the Vaccinia palustria Dodonai, before set forth, which Lugdunensis calleth Erica baccifera Dodonai, no the Oxycoccum Cords, being all one.

The Vertnes.

I have reserved the declaration of the Vertues of all the sormer, unto this place, that I might shew you the altogether. Heath is somewhat drying, and a little bitter withall, except the berryed forts, as Clussum bath related by the raste of most of them. Galen saith it bath a digesting quality, resolving the malignity of humours, be transpiration or sweating, which a decoction of the slowers being drunke, doth performe, and thereby given much ease to the paines within the body, and expelleth the wormes therein also: the leaves and slowers mad into a decoction is good against the sting or bitings of Serpents, and other venemous creatures, and the same being drunke warme saith Matthioius, for thirty dayes together, morning and evening, doth absolutely break the stone and drive it forth: the same also, or the destilled water of the whole plant, being drunke easeth the cholicke: the said water or the juyce of the herbe dropped into the eyes helpeth the weakenesse of the sight clussum said that Rondeletim at Mompelier used the cyle made of the flowers of Heath with good successe against the Wolfe in the face or any other soule or fretting and eating canker spreading over the whole sace: the same also doth dissolve tumours: a bathe made by decoction of the herbe and flowers is good for them to fit in, that are troubled with the stone, or with the gout, for it giveth muchease to them both: the white berryes of the Heath shith Clussum, are bought to the markets in Spaines, and there sold to give to those that have hot agues, to coole the heate and quench their thirst; and besides are much desired saith hee, of women and children, to please their pallate: the hony that the Beestake from the flowers of Heath is called mel improbum, but we have not found any ill quality therein in our Land: onely it will be higher coloured then in those places where no Heath groweth.

CHAP. LXIII.

Agrifolium five Aquifolium. The Holly bush or tree.

Ome have thought that there are divers forts of Holly, some trees, some shrubs, some with prickly leaves, and some with smooth, but the truth is, it is but of one fort, for although it hath been seen in divers places to grow to be a great tree, as Gesses in the row reporteth, of divers, and of one at Curia thirty foote high, whose leaves were smooth and not prickly, yet no doubt but it rose from a young shoote that was prickely at the first, for while it is suffered to shoote forth sundry roddes from the roote, or before any of them growesh to be great, the leaves are prickely. but

roddes from the roote, or before any of them groweth to be great, the leaves are prickely, but growing old as the **Ilex** doth, it loofeth the prickles and becommeth fmooth, and onely prickely at the end, and fometimes not. It is with us most usually a bush, and with many shootes from the roote growing slowly, unlessed the ground be not gravelly, where it most frequently is found, but more mellow and gentle; the outer barke whereof is of a sad greene colour, but it hath also another inward, which is whiter: the leaves are set on the stalkes and branches on short sootestalkes, being somewhat broad, hard, thicke and long, smooth shining, and of a very fresh yellowish greene colour, cut round about the edges, into round notches or dents, and every point of them very sharpe and prickely; the showers grow close to the stalkes, at the soote of the leaves many comming forth together round about them, and consist of foure white leaves with foure threds in the middle standing about a greene round head, with growesh to be a small red berry when it is ripe, like unto a Hawthorne berry, but with a little Crowne at the toppe which parteth into soure small triangular seede, with hard shels, and a small sweete kernell within them, abiding on all the Winter, almost in his greatest beauty: the roote groweth deepe, the wood is firme and hardly sinking in water, and of a whitish colour.

2. Aquifolium undique echinatum. Holly with leaves wholly prickely.

This different not from the ordinary fore, either in body, barke, fruite, roote, or use, onely in the leafe, which is no less a med with sharpe prickles, all upogras about the edges thereof.

The Place and Time.

Holly groweth in waste and untilled grounds, in divers Countries throughout the whole Land, and as I said seldome groweth with us to be a tree of any bignesse, it flowseth in Inne, and the berryes grow ripe, not untill the end of Ottober, and then abide almost all the Winter long, being freshest at Christman, the leaves doe alwayes abide greene.

The Holly buth or tree,

2. Aquifolium folio leni 19º aculeato toto.

Holly with smooth leaves, and one all over prickely.

the berryes being taken doe purge by stoole, grosse clammy and slegmaticke humours: Gerard appropriateth these words to himselse, as if he had had the relation, and yet he saith within a few lines after, that Holly beaten to pouther, and deunke doth stay fluxes and discenteryes, which are quite contrary one to another, upon a suddaine apprehension, but upon better consideration they may both stand for good that the fresh berries, by reason of their moist flipperinesse may move the belly downewards, and the berries being dryed, and thereby having loft their moisture and slipperinesse, doe then binde the belly as we have knowne by many experiences: but the barke of the tree, or the branches, is held to be much more effectuall to binde then the herries : Manbiolus faith mata decoction of the rootes of Holly (but faith he the barke of the roote is more powerfull) fomented on the places that have beene put out of joynt, doth helpe them much, both to mollifie and discusse the hardnesse and mmours, the places gather thereon, and helpeth alfo to confolidate the broken bones : forme we to tie the branthes with leaves upon their Bacon, and Martinmas Beefe, to keepe Rats and Mice from them by their prickles : inchranches with berries, are used at Christ tide to decke up our houses withall, but that they should defend the bouse from lightening, and keepe themselves from witchchraft, is a superstition of the Gentiles, learned from Pliwith Matthiolus : with the flowers of Holly faith Pliny from Fithagores, water is made ice : and againe, a laffe of the tree throwne at any beaft, although it fall fort by his defect, that threw it will flye to him, as he lythillil, by the speciall property of the tree : This I here relate, that you may understand the fond and vaine conceits of those times, which I would to God we were not even in these dayes tainted withall. The Birdline made of the rootes of Holly, is as good as that made of Miffeltoe, whereof neither is to be admitted into inward Physicke without certaine death or danger.

CHAP. LXIV.

Laurus. The Bay tree.

Nder the name of Laurus is described sundry sorts of plants by the ancients, as Laurus Alexandrina, Chamedaphue, Daphneides, and Laurus Timu, and Taxa, and others, whereof I meane not to entreate in this place, having spoken of them already in others, but of those trees that are properly called Bay trees, which are two. onely knowne to us in Europe, the one with broader, the other with a lesser leafe (and yet Bellonius saith, he observed five forts in Mout Athor and Greece) where with a lesser leafe (and yet Bellonius saith, he observed five forts thereof in another place, but unto them I will adde another fort of rare Indian Bay tree, lately knowne unto us.

1. 11111 2

TREBE 16.

3. Laurm Americaya çaborto Farnessiano c. njucurter Cassa Lignea muitum assimilatur. A strange Indian Bay tree, or Cassa Lignea of the West Indies.

1. Laurus major five latifolia. The greater Bay tree.

This Bay groweth with us in many places, very high, fpreading armes and branches reasonable well, covered with a darke greenish barke, the leaves are somewhat broad and long, hard, full of veines, of a darke greene colour, pointed at the ends, and smelling somewhat sweete, but of a bitter talle, and alwayes abiding on the trees, the flowers grow many together, and of a whitish greene colour, after which come somewhat long and round berries, with a tough blacke skinne or covering, somewhat wrinckled, with a hard firme kernell within, parting into two parts, the roote spreadeth under the ground, and growth deepealso: the wood is firme, smooth, and white.

2. Laurus miner. The leffer Bay tree.

The leffer Bay tree groweth not so high, and doth runne more into suckers or shootes, wheteon grow smaller thinner, and longer leaves then of the former, yet smelling well also, therest of the parts doe not vary much, but that the berryes be smaller and rounder.

3. Law-us Americana cujus cortex Cassia lignea multum assimilatur.
The strange Indian Bay tree, or Cassia Lignea of the West Indies.

I must needs adjoyne this strange Indian Bay tree, both for the rarity and excellency thereof, which I take out of Tobias Aldinus his description of some plants that grew in Cardinall Farnesius his Garden at Rome, and grew from the berries were brought from the West Indies, in that Garden of the Cardinall 1620. Which were blacke rugged, like Bay berries, and somewhat long like Ollives, pointed at the end, and divers growing together in a bunch each upon a fhort footestalke, it shortly grew into a great height and bignesse, the leaves were very like unto Bay leaves, or rather in a meane betweene the great Kings Bay (which I take to be that we call Laurocera-(us) and the common Bay or the Citron tree, which being chewed, at the first are somewhat bitter, but after with a fweetnesse have some maccilaginousnesse or clammynesse in them, yet smelling like the common Bay, whose footestalke is thicker then of them, and the branches smaller and finer : but faith it is wonderfull to feele fo much viscide and tough clamminesse in them, which made a doubt with some learned Herbarists, whether it were not the tree of Cinamon, or of Caffia or Canell, and that not by any light conjecture, for Garzias ab oris faith the leaves of the Canell tree are of the colcur of Bay leaves, but neere the forme of the Citron tree leaves, and all Authours writing of the trees of Cinamon or Carell, fay the leaves are like Bay leaves: the fruite also by Garzias of the Canell, is blacke and round of the bignesse of an Hafell nut and like an Ollive. Govern, Corato, and Cossa fay that the fruite groweth in clusters or bunches, Acoffa that the fruite is blacke and shining, when it is ripe, the maccilaginous tafte also in this plant, seemeth to be in that fort of Canell is thought with us to be the true Cassia lignes, yea the best Cassa with Diestorides is called Daphnita which is a word derived from Daphne which is a Bay : but faith he, I will shew you my opinion, that we have no true Cinamon, although I have read of many that affirme our Canell to be the true Cinamon of the Auscients, yet I have faith he, many reasons aginst it, which for brevity I here omit, hoping to declare them in another place.

The Place and Time.

The Bay groweth wilde naturally in divers places of Narbone in France, Spaine, and Italy and in other warme Countryes where it groweth very great effectally neere the Sea, but is wholly planted with us; or raised from fowing the berriess: t flowreth in May, the fruite is fearet thorough ripe either in Oliobersor November.

The Names.

It is called Augm in Greeke, quafi diapam quod usta valde some, for nothing doth more trackle or make a notice the firethen it: in Latine Laurum: much Gentilisme might be inserted here of Daphne, the Daughter of Laurum, whom e-spollo overtooke flying from him, and by the implored aide of her mother earth was transformed in a Bay, from whence taking a branch, he in honour of her, crowned himselfe: but under this rugged shell was it amounter kernell: for the Bay was a token of prophecy, and by Apollo is signified wildome: that is, that wildome doth foreseevents, when the passions be overruled: a salio that they wore a Garland of Bayes to be best safe from lightening and thunder: that wisedome knoweth how to avoide the judgements of God, when sufficiently is liable to them, and must undergoe them. The Arabians callit Gaur or Gar, the Italians Lauro, the spaineds Laurerro, the French Laurier, the Germanes Lorbeenbaum, the Dutch Lauruboon, and we the Bay tree: the best years are called in Greeke dustile, in Latine Lauri bacca.

The Vertures.

Galen faith that the Bay leaves or barke doe dry and heale very much, and the berries more then the leaves: the the of the roote is leffe tharpe and hot, but more bitter, and hath some aftriction withall, whereby it is effectu-Albertake the stone, and is good to open the obstructions of the Liver, Spleene, and other inward parts, as the topic and jaundife: the berryes are very effectuall against all venome, and poyson of venemous creatures, and helings of Waipes, and Bees, as also against the pestilence, or other infectious diseases, and therefore is put into indry Treakles for that purpose: they likewise procure womens courses, and it seven of the berries be taken by woman in fore travell of child birth, it will cause a speedy delivery, and expell the after birth also, and thereme women with child that have not gone out their time, mult take heed of taking any, left they procure an amement, or delivery before their time: they wonderfully helpe all cold and theumaticke distillations, from the braine to the eyes, lungs, or other parts, and being made into an electuary with honey, they helpe the conimption, old coughes. (hortneffe of breath, and thin rheumes: they likewife helpe the Meagrome, and mightirecell winde, and provoke urine, and helpe the Ventofities of the mother, and kill the wormes : the leaves worke also the like effects, and boyled in fish broth, give a fine rellish, both to mea e and broth, and helpeth to rume the stomacke, and to cause digestion, without feare of casting, which taken by themselves they oftenmes provoke: a bathe of the decoction of the leaves and berries, is fingular good both for women to fit in that monobled with the mother, or the difeases thereof, or with the stoppings of their courses, or for the diseases of hebladder, paines in the bowells by winde, and stoppings of urine : a decoction likewise of equal parts of Bay uries, Cuminseede, Hyssope, Origanium, and Euphorbium with some hony, and the head bathed therewith, wh wonderfully helpe destillations and rheumes, and setleth the pallate of the mouth into its place: the oyle which is made of the berries, is very comfortable in all cold griefes of the joynts, nerves, arteries, stomacke, belly a wombe, and helpeth palfies, convultions, crampes, aches, tremblings, and numneffe in any part, wearineffe alb, and paines that come by fore travelling in wet weather, or foule wayes: all gricles and paines likewise proreding from winde, either in the head, stomacke, backe, belly or wombe, by annoyating the parts affected thererith, and by putting some of the oyle, or boyling the berries in the decostions for glisters, doth breake wind adeale the torments of the belly by the winde chollike wonderfully: it helpeth also the paines in the cares, eiby some of the overdropped thereinto, or a decoction of the berries being made to receive the warme fumes bacof into the cares by a funnell: the faid oyle taketh away the markes of the skinne and flesh, by bruises, falls. ke, and dissolveth the congealed blood in them: it also helpeth the itch, scabs, and wheales in the skinne.

CHAP. LXV.

Arbutus & Adrachne. The Strawberry trces.

Hese two trees doe both goe under one English name of the Strawberry tree, because they are so like one unto another, both in their growth, leafe, and fruite, that one not very well acquainted with them, may soone mistake one for another, and therefore I have thought good so put them both into one Chapter.

1, Arbum. The Strawberry tree with dented leaves.

This Strawberry tree (in some places, as in Mount Athos, as Bellonius reporteth, growith to be a tree of very get heighth and bignesse) in most other places it groweth but low, or rather like unto a shrub tree then of any ignesse, having a rugged barke on the body, and smooth or red on the young branches, and having many suckardising from the rootes, with faire fresh greene leaves, fet without order thereon, very like unto Bay leaves, but thicker, shorter, and sinely dented about the edges, and without any sent, as the Bay leaves have, with a reddin middle rib in some places, but not usually so with us, and abiding on the bushes like the Bay: at the ends of the branches come forthlong stalkes, with very sine white showers set thicke together all the length of them whose immes are a little red or blush colour, formed like unto little bottles, or the flowers of Lilly convally, which king past, there rise in their places, severall round betryes, greene at the sirst, yellowish afterwards, and of an teclestreddish colour, and somewhat hoary withall being full ripe, like unto a Strawberry, but much greater take naturall warme Countries, as great as a plumbe, but with us, and in Ireland, where they have beene found gowing of their ownessecord, no bigger then a Raspis berrie, and neere unto the same, both forme and colour, out is like a pallide clarret Wine, of an anstere taste, and having certaine small scades within them each of them lovered with a tabuse existence.

Littli 2

1. A buius, The Strawberry tree with dented leaves.

2. Adrachae. The Strawberry tree with fmooth leaves

2. Adrachne. The Strawberry tree with smooth leaves.

This other Strawberry tree groweth low and never seens so high as the former; but so like thereunto that it is discerned from it onely by these markes; the barke of the tree and branches is not rough or rugged but smooth and redder by much, both in young and old branches like unto Corrall, yet Theophrasis saith it hath a white barke, which it is like he meaneth of the under or new barke that commeth after the old falleth away in Summer, but the Arbusus doth not for the leaves are so like unto Bay leaves, being also smooth and not dented on the edges that they are onely distinguished from them by the smell, these having no sent, and the berries hereof are of a darker red colour, and somewhat more sweete, the other being a little austere or harsh, and so talting on the tongue in the eating.

The Place and Time.

Both these forts grow in the warme Easterne Countryes abundantly as also in Greece, and the Isles of the Mediterranean Seas, especially in Candy, on the hills, and among the Rockes, but the first especially in Italy, Spaine, and fome parts of France, and hath beene of late dayes found in the West part of Ireland, of a reasonable bigge file for a tree, but with smaller fruite: it flowreth not onely in Iuly, in the warme Countries, but at other times of the yeare also, and the fruite scarse ripeneth in a whole yeare, for I have seene a fresh branch, that was brought me with fresh sprung flowers and ripe fruite thereon likewise, so that it is usually seene both with flowers and fruite at once. The Adrachne is every third yeare spoyled of the outer barke, and regaineth it quickely, and keepeth the fame time with the other.

The Names.

The first is called in Greeke vouces Comarus, and the fruite so also by some, or wendin Memacylon, as Diescorides, Galen, and others fay, in Latine Arbutus & Unedo, and by Ovid Fraga montana; some have thought that the Arbutus of Dioscorides, and Theophrastus were differing plants, because their descriptions were so divers, but by the judgement of the best they are both one, the other is called in Greeke adeixm, yet the most Greeke copies have an I can't because Adrachne, is the herbe Portulaca, Pursiaine, which some to distinguish would call this Portulaca arbor, but Pliny findeth the fault, and therefore calleth it Adrachue and Potulaca arbor, fince which Gaza and others have followed him therein: but the Grecians generally now adayes, as well as those in Canay, call it Adrachla, as Honorism Bellim faith : all our moderne Writers call them, by the fame names, and no other then are here set downe, except Guilandinus in Papyro, who attributeth all these names to one plant Omarum, Conarum, Arbutus & Vnedo, And it is observed that Galen faith in Italy among the vulgar, Epimelis was called by the name of Unedo, peradventure because the flowers of Epimelis are very like to those of Arbutus or Fredo, when as Epimelii is defined by himselfe to be another plant, differing both from Arbutus, Unede, or any of Dissertides forts of Mefpilm. The Arabians call the Arbusm Hasiladib, the Italians Albatro, the Spaniards Madroube, and Madromeiro, the French Arboufer, the Dutch as not knowne to them have no name that I can finde, and we call TRIBEI6. them both the Strawberry tree, but with the feverall diftinctions that I give them in their titles ; yet it hath come to us from Ireland, by the name of the Cane Apple, with as great judgement and reason as many other vulpar names are.

The Vertues.

Diescorides and Galen lay of the Arbutm that it is troublesome to the stomacke, and breedeth head ache, and merefore adviseth those that have any paine in the head to forbeare the eating of that fruite, Amatus Lusitanus first feneth it downe, that the deftilled water of the flowers and leaves of the Arbutu (but Mathiolan addeth the at & Corde cervi to be mixed therewith in pouther) is a foveraigne remedy and helpe against the pessilence, and all other venome to be given presently upon the first complaining of the griefe, it is all ringent or binding, and herefore may well ferve against fluxes: the properties of the other are not declared.

CHAP, LX VI.

Morns. The Mulberry tree.

Here are two or three forts of Mulberries as I have elsewhere shewed, yet I must shew you them

1. Morse nigra vulgarie. The common blacke Mulberry tree. This groweth if it be suffered very great and tall, otherwise it will be led on Arbours, or as

you will have it, the body being great, and both it and the greater armes covered with a thicke ruggedbarke, the younger boughes and branches being imoother, whereon are round broad laves fet, pointed at the end, dented about the edges, and fometimes gashed in on the edges, resembling a Vine lase, the bloomings or flowers are short downie catkins, after which follow the fruite made of many graines fettogether greene at the first, red afterwards, and somewhat harshe or sowre, but blacke when they are full ripe, full of a sweetish juyce, that will dye the fingers and mouth of them that gather and eate them : wherein lye di-

vers small seed, the roote groweth not deepe, but spreadeth farre, being of a yellowish colour. 2. Morus alba. The white Mulberry.

The white Mulberry groweth not to that greatnesse, but riseth higher, more knotty and brittle, spreading reasonable well, but not so thicke, the leaves are like the former, but not so thicke set on the branches, nor so hard in handling, of a paler greene, and somewhat longer, and more divided with longer stalkes: the fruite is smaller and closer fer together, greene and somewhat harsh before they are ripe, but exceeding sweete, almost ready to procure loathing, when they are thorough ripe, and whitish, with the like seede as is in the former: the roote likewise is yellow but paler.

1. Morm nigra vulgaris. The common blacke Mulberry tree.

2. Morus albs. The white Mulberry tree.

TRIBE 16.

3. Morse Virginiana. The Virginian Mulberry.

The Virginian Mulberry groweth quickely with us to be a very great tree, spreading many armes and branches, whereon grow faire great leaves very like the last: the fruite or berry is longer and redder than the first when it is ripe, and very pleasant also.

The Place and Time.

The two former forts are noursed up as it were in Woods or great Orchards, in the Levant Countries to nourish their silke Wormes, where they keepe abundance, and may peradventure be naturall in some of those places; they are plentifully also noursed up in Italy for the same purpose: but the last as the name imported came from Virginia, where it groweth hugely, with great store of great leaves and small store of fruite, but in the scason with the other, which is in Insy and Angust, yet the leaves of them all appears the last of all other trees.

The Names.

It is called in Greeke west and origina? Morea & Sycaminos, in Latine Morm; some call the first Morm rabra, and others nigra, in our shoppes Morm celsa quasi excelsa, as a distinction betweene it and the bramble Rubin, whose berryes are called also Mora; but bas is added to know it by, the white is called Morm alba & candida by all the Belonius saith that the French doe falsely call it Sycomorus, but we shall she wy ou the true Sycomorus by and by. The Arabians call it Tut and Thut, the Italians Moro, the Spaniards Moras del Moral, the French Meurier and Meure, the Germanes Maniberbaum and Maulbeer, the Duich Mooerbescemboom, and we in English Mulberry, and Mulberry tree.

The Vertues. The Mulberry is of different parts, the ripe berryes being by reason of their Iwectenesse and slippery moisture. opening the belly, and the unripe binding it, especially when they are dryed, and are then good to stay fluxes and laskes, and the abundance of womens courfes: but the barke of the roote hath a stronger purging quality, and a bitteine ffe withall, whereby it is able to kill the broad wormes in the body of men or children: the leaves and young tender toppes have a middle or temperate faculty: the ripe berries if they be taken before meate, doe make passage for the rest to follow, but if after meate, and passe not quickely away, they corrupt in the somacke and draw the rest on to putrefaction with them, otherwise they trouble little : the juyce, or the syrope made of the juyce of the berryes, helpeth all inflammations and fores in the mouth or throate, and the Venla or pallate when it is fallen downe: the juyce of the leaves is a remedy against the biting of the spider Phalangium, or any other Serpent, and for those that have taken Aconite, the leaves beaten with Vinegar is good to lay on any place that is burnt with fire: the leaves of the Vine, of the earely Figge, and of the Mulberry, boyled in raine water is good to wash the haire, to cleare and to give it a faire colour : a decoction made of the barke and leaves is good to wash the mouth and teeth when they ake : if the roote be a little slit or cut and a small hole made in the ground next thereunto, in the harvest time it will give out a certaine juice, which being hardned; the next day is of good use to helpe the toothache, and to dissolve knots, and purge the belly: the leaves of Mulberries are said to stav bleeding in any place of the body, whether it be at the mouth or nostrils, or the bleeding of the piles, or of a wound, being bound unto the places: a branch of the tree taken when the Moone is at the full, and bound to the wrist of a womans arme whose courses come downe too abundantly, dothstay them in a short space, theleaves laid to steepe in urine doe take away the haires from skins.

CMAP. LXVII.

Sycomorus. The true Sycomore or Mulberry Figge.

Here are two forts of this Sycomore tree, the one bearing fruite out of the body, and greater armes of the tree onely, the other upon stalkes without leaves.

1. Sycomorus sive Ficus Legypiss. The Sycomore of Egipt.

This Sycomore groweth to be a very great tree, bigger then the Mulberry tree, with great armes and branches, and thereon full of round and somewhat long leaves pointed at the ends, and dented about the edges, very like the round leaves of the Mulberry tree, but harder and rougher like Figge leaves, this beareth small sigs or fruite, and no shower, and that differing from all other trees, for it thrusteth them forth from out of the very trunke or body it selfe onely, and the elder branches next to the body, and no where elle, and are very like unto white or wilde Figges, and of the same bignesse, but much sweeter, and without any kernels therein, the whole tree and every part abounded with milke, if the barke be but gently wounded, for if deepe it giveth no milke at all, which maketh it to beare three or four times every yeare, new rising out of the places where the old grew (but whereas Theepbrassum and Dioscorides say, that the fruite ripeneth not, unlesse they be carached with iron scratchers, and that within soure daies after they will be ripe; theuse in these dayes, where they grow is, that they doe ascend the trees, and with small knives, cut a small peece from the head of every sig, while they are greene, and after the poorer fort of people cate them. The wood hereof is sollid, hard and blacke, and abiding fresh, and as if it were still greene long after it is felled, neither will become dry, unlesse the kept under water, and therefore is fitted to make piles in Marshes, or waters.

2. Sycomorus altera fem Firm Cypria. Another Sycomore or Figge of Gyprus.

This other Sycomore groweth to be as great as a Plummetree, or white Poplar tree, whole armes and branches are flored with broad and somewhat round leaves, like unto the Elme; (which made Diofeorides say it was an Elme) but indeed very like unto the former: this also beareth such like fraite like Figges but smaller, even no bigger then plummes which rise both from the body, and the greater armes, but not immediately out of them, as in the former, but on certaine stalkes is branches, which rise by themselves, without any leaves with them, and are as sweete as sigges, and beare also source times every yeare, but not unless they be sit, that the milke in them may come forth.

The Place and Time.

The first groweth chiefly in Szipe in Szria also, and Arabia, and other the places neere thereunto: the other in in

sCyprus, Caria, Rheder, and other the places neere them; they have not beene brought into Italy that I meane; their Time is expected in their description

The Names.

The first is called in Greeks uniques and our jure alloy some, but not rightly as Thinferrides saith; in Lacionalto Syconorus, and Pieus Hyppia, the Esprian sig, as in the true Syconorus exec, and Theophrafia callett is Moras Agypta, to called as Galen saith, from helikenesse of the gree and the fritte unto the Mulbergand the Figgs. Relations fixth the Esprians now there call it First Pharaonis in their language, and one simmers as the Arabians does the other is called by Theophrafias Fican Cypria in Green, Masthishus called it Sycomore finish, Corden on Disservices, Sycomorus a Cypro, and Lugdensen is from Ranwellius Fican Egypus Disservices, Sycomorus Cypro, and Lugdensen for Green, and Adametic of the Arabians.

The Tierties.

The fruite of the Syxcimore trees agree well in the legy, and maketh it folible, but is troublefome in the lonacke, by the overmuch moifture, and giveth but littenourishment to the body: the milke that is taken from the tree, by wounding it gently, and afterwind dryed and made into Trochifees, and kept in an orden pot, bath a property to mollifie hard tumours, sloder or close together the lippes of greene wounds, thrintie it else being laid plaisterwise, worketh after the time manner: the faid dryed milke is good against memous creatures and the plague, the same also each the paines in the head and eares, and is drinke by the metal are splenoticke.

1,2. Sycomorus frue Fices Egyptia & Cypria.
The Egyptian and Syrian Muberry Figgerre.

CHAP. LXVIII.

Fiew. The Figge tree.

Here are divers forts of trees that are called Figge trees, very much differing in kinde one from another, I will therefore in this Chapter onely shew you the forts of our ordinary eating Figges that grow in Europe, and afterwards of the refit that have not been declared before.

2. Ficus saive five vulgaria. The ordinary Figge tree.

This ordinary Figge in our Country in fome places, I have feene as great almost, and as much first as an Appletree, with a grayish rugged barke on the body, and elder boughes, and greene on the younger, which are hollow or pithy in the middle, the leaves grow fingle on the branches, being long and large, thicke, weigh, and of sad a green colour on the upperside, and whittish underneath, divided into three, but usually into five arm, yeelding a sharpe bitter, and almost exulcerating milke when they are broken, as the branches and the rigges also will doe when they are greene, the fruite breaketh out from the branches without any flower, and whoth of sundry colours, of several sizes, and ripening at contrary times of the yeare, as also with thicker or summer skins that cover them, these that are most ordinary are white, and of a reasonable bignesse.

This Figge tree differeth not from the former, but in growing not fo great, and that the fruite is small and had, never ripening on the trees, but falling off unripe and are nothing to sweete or pleasant as the manured, but is ripe and mellow, or soft, but like it while it is greene and hard.

3. Firm nigra five praces. The blew Figge earely ripe.

This tree also differest not in the growing from the former, but riseth not to that greatnesse, the fruite is also like the former, and of the fame size and bignesse in Spaine and other places, but of a darke purple blacklish color, with an eye of blew as it were cast over them, and blacklish red throughout, being not fully so lushhous sweet as the ordinary white Figge is: this Figge tree bearest twice in the years in the warme Countries, that is in the Spring about April, and afterwards in the Autumne when the other are ripe: those in the Spring doe kideme ripen kindley, for want of the heate of the Sunne, and by reason of the mailture of the season, yet are they very delicious, so that they quickely both putrifie if they be kept long, and not artificially dryed, but quickely orthogolasses that eate them, and therefore none dareth eate them, but they must drigke some when them to helpe to digest them, for if they passes not quickely out of the stomacke, but putrifie therein, by put them in danger to turne them into a seaver: and this is that kinde of greatblacke Figge, that we have, which list usually planted against a wall, and yet will not ripen the fruite with spatial Angust, and then will be so mellow and soft, and moils that they will be ready to fall about their sine that had be them.

The dwarfe Figge tree groweth not much higher with us then to a mine fhoulders, with flender branches ben-

I Ficus vulgaris. The ordinary Figge tree.

ding downewards: the fruite or Figges are smaller, even in our Country then the last, but of the same colour, and reasonably well stored on them, this is tenderer then the other, and is usually planted in boxes, to be removed into stoves for the Winter time, and ser abroad in Summer like our Orenge trees. The Place and Time.

The manured Figge hath beene as I suppose alwayes planted where it grew in any Country, the wild being found so in lundry places, it is thought that both the other came out of Barbary into Spaine, Italy, and other places where they grow, and beare ripe fruite both in the Spring and Angust, or September, which in Spaine are after the gathering laid in the Sunne to dry, that they may the better be kept all the yeare after. The Names.

The tree is called in Greeke συκή and the fruite σῦκον, in Latine Fieus both tree and fruite : the wild Figge tree is called in Greeke own at example excess by Galen and others, in Latine Ficus fylvefiris, & Caprificus; the unripe fruite of the manured, as alto of the wilde kinde is called in Greeke and in Latine Groffin, but properly Olynthus, as well as Groffin doe fignifie the earely ripe of each fore: the dryed Fi ges are called in Greeke 196 As, and of some weit, as Paulus Æginetus and others, in Latine Carica, yet Pling faith that Carica is a peculiar kinde of Figge, growing in Syria, to you fee the word is used both by Greekes and Latines, the graines or small kernells within the Figge is called by the Greekes xey equidus, and by the Latines Ficaria, Pliny lib. 15.c. 19.calleth them Frumenta, the earely Figges are called in Greeke weid una quali precurfores, in Latine pracoes and Groffi of fome as is before faid, the branches of the tree are called Grade both in Greeke and Latine, yet Nicander his interpreter doth call the Figges themselves so. In the West Indies where it hath beene planted by the Spaniards, it never loofeth the leaves, God to providing them a reasedy at all times against the venome of their Spiders, which is the milke comming from the tree, when the leaves are broken off. The first is usually called Fiera sativa, or communic by all : In our Summer Islands they grow so mellow, as that they will be dryed at no hand to be kept long, as those in Spaine are (which commet h to passe as I thinke, for want of skill in taking them in their fir time, that is, before they grow too ripe and mellow.) The fecond as I faid before is called Ficus from free and Caprificus. The third is called Ficus nigra, or purpurea, and of some Ficus de Agarva, yet some doe hold that the last or dwarfe Fig is more truely called fo, and some that they may be both called Ficus de Algaria: it is generally called Chamasicus, or humilis Ficus, and Ficus pumila by diverse, Lugdunersis calleth it Chamasyce arbore. The A. rabians call it Sin, or Fin, or Tin, the Italians Fichi, the Spaniards Hygos, the French Figues, and the tree Figuier, the Germanes Feighenbaum, the Dutch Feigenboom, and we in English Figges, and Figge tree. The Vertues.

The Figge tree is hot, and of thinne parts, which the milke that iffueth from the leaves and branches, being broken, and the juyce taken from them, when they are young and pressed forth, doe plainely declare, being exceeding hot, not onely biting and sharpe, or forcibly clenting, but even exulcerating and offending the mouthes of the veines, and taking away wartes, as also that it purgeth, yet is it not safe to take it inwardly, for seare of exulcerating inwardly, yea the branches of the tree are of such an hot temper, that if they be put to be le with Becte

Recfe that is hard, it will thereby become tender and foft, the wilde Higge tree, and the milke thereof is more rectual then that of the manured : if the leaves of the Figge tree be rubbed over the piles, they will open asine and bleede: the Figges themselves are hot and moist, and nourish well, the dryed better then the greene, other be temperately taken, for the continuall use of them breed ill blood, puffe up the body with loose fieth, and cule them to become lousie; yet Galen faith that the use of Figges and Grapes, in his old age, above all other fruit Aid him leaft harme: if they be eaten while they are fresh and greene, they loosen the belly, but doe fomewhar mable the fromacke: the dryed Figges doe heate the fromacke, and cause thirst, yet they nourish and are good for the throate, and arteries, the reignes and bladder, and to regaine a good colour to them that by long fickemis have loft it: Figges are one of Mithridates three ingredients into his antidote, against both poylon and Plague, as you have heard before in Wallauts and Rue: the decoction of Figges, Hiffope and Licoris, is a very god Prilane drinke to helpe an old cough, hoar fene ffe and shortnesse of breath, and all the diseases of the breit ad lungs, and is good also in dropfies, and the falling sicknesse, and for the Quinsie also, a flit sigge tosted and bild on a king tooth, doth often ease the paines; two or three Figges flit, and laid all night in agra vita, are very good for those that are pursie and short winded, to take them in the morning. Figges bruited and apwith Barley meale, and the pouther of fer u trecke feede doe mollifie the hard tumours and kernells, under the throate and eares, and elfewhere, as also the hardnesse of the Mother, and is some leaven and salt be put to them, it breaketh Plague fores, and it may be was the same Hezechias used: they are mixed also, not as Pliny hath it with relieve as Duc, id off flore wis (but with xares De Calcantha, that is, Copperas, as Diofeorides hath the word being miltaken by Pliny,) against the inveterate fores of the legges, and all other foule running ulcers : being byled in Wine with Wormewood, and then applyed with barly meale, are very profitably applyed to the belly of those that have a dropsic : and beaten with salt and applyed, taketh away the itch and scab, and the ashes also of them being made up into a salve and applyed, healeth kibes, and chilblaines: the dryed milke of the wild Figge. me, as well as the tame doth curdle milke like rennet, and diffolveth it being curdled, as vinegar : this milke othe juyce taken from the young lancke branches, is moith fit to use inwardly against the poyson of Gypsum, and the Phalangium Spider, but outwardly applyed it is good for many things, as put into an hollow tooks, it can
the the paine, the same mingled with the juyce of Mustard, and dropped into the eares, easeth the paines, noise,
and itch in them, and helpeth the deaseness; applyed to a place bitten or stung, by any mad dogge or venemous centure, taketh away the paine and danger together: the fame also made up with Barley meale, healeth the mining forces of the head, and likewise helpeth the Lepty, Morphew, the white scurse, and moist scabbes, pushes, wheales, and all other eruptions in the skinne, or discolourings in the face: the lye that is made of the branches of the wilde or tame Figgetree, being burnt to albes, after it is cleered, is accounted among causticke medicines: inhelperh running cankers and Gangrenes, and confirmeth Warts and Wennes, by dipping fome Wooll or Spung therein, and dayly applying it thereto, and is sometimes dropped into hollow Vicers, that fret and creepe, an se full of moist humours, for it clenteth, sodereth, and bringeth up flesh therein, and closeth up the lippes there of, like those plaisters that are applyed to greene wounds: it is likewise drunke by them that have the blood fixe and old defluctions; to disperse also the congealed blood in the body, by any bruise or fall, adding theret. alittle oyle and water, and fo it is taken by them that have either rupture or convultion. Ruelling faith, that : Bull, be he never so mad, be tyed to a Figge tree, he will quickely become rame and gentle: and some have affirmed, that the Figge tree and the Bay, are not blatted with lightning. The blew Figge is no doubt of the fame operation with the white to all purpoles, but the fruite commeth most to maturity with us, and eaten with great pkafare with falt and Pepper.

CHAP. LXIX.

Musa arbor. The Indian Figge or Plantaine tree.

Vors doe make this tree (or plant, which loever you pleafe to call it, in that it dyeth yearely) one of the forts of Dates, but very erroniously, for it may in my judgement be more truely referred to the Figges, as divers others doe, and therefore I thinke meetelt to be joyned unto them. It if eth up to the heighth of fixe or fever cubits, with a fixed by the more of falls, as himself and the state of the long of the content of the long of the of fixe or feven cubits, with a fireight stemme or stalke, as bigge as ones thigh of arme, not wooddy at all, but of a foft substance, and as it were composed of a number of soulded leaves together, so that it may easily bourdowne with the blow of a fword, or with a knife, with a pith like marrow within, not spreading any banch at all, but compassed about with many very large leaves, foulding themselves as they rise, like the leaves of the flowring Indian Reede; which when they are spread open at large, are each of them a fathome sometimes ormore, and ufually foure or five foote long, and two foote, or formetimes a yard broad, hanging almost quite sowne, with a great thicke rib running through the middle, and not cut in on the edges in any place: the lower twesstill falling away being dryed, and broken off with the winde, leaving the stemme or stalke bare, until it hive arrained unto above a mans height, where it busheth forth a many the like large leaves, that are of a darke reme colour on the upperfide, and palet underneath; in the midft whereof thrufteth forth a great long bunch of lowers; as bigge as an Estridge egge, of a russetish purple colour, divided into many chiffers, each flower where on the one is Litionarcissom of such a color of the one is Litionarcissom of such as the fruite supplement of the one is Litionarcissom of the fruite supplement of the one is Litionarcissom of the fruite supplement of the original growing in the fame manner in clusters, at feverall spaces or distances of the great long stalkes, two or three undred many times together each whereof is long and round, in some places greater and smaller then in others, have a span long or more (and one fort in the Kingdome of Congo, is smaller, but better rellished then the ordi my, yet rare and not to be found but in very few places elfe that I can learne) fomewhat refembling a small Cowcumber, of a firmer substance then a Figge when it is cut, and without any graine or kernell within it, haing a little hollownesse in the middle, where it may seeme to be parted in twaine, and are of a darke greenish cour being unripe, but of a whitish yellow if they be suffered to grow to the full mattrity, but many doe cut them downs before they are through ripe, and either hang them up in their houses to ripen, or to carry to Sea to fend afterwards, for being gathered ripe, they will not last long : the outer skinne is to be pared or preled away before

1496

before they are eaten. the inner substance being yellowish, and of a fine tweete tafte, not fuddenly to be perceived, yet I having tasted of one that Doctour Pay gave me, did thinke I had talted of an Orris roote, preserved with Sugar, which peradventure was not the naturall rellish thereof, but ascititious. Vnder the stalke with fruite, hangeth downe on another stalke, a tuit of leaves, which some while after will bee an. other bunch of fruite, usually bearing twife, and in some places thrice every yeare: when the stalke is cut downe, to ne fay that it yeeldeth a kinde of water like milke, both for colour and taile, some say also that the roote beareth but once or twife, or thrice at the most: but the certainety is, that it needeth to be but once planted, for that it continually tendeth forth new thalkes, as the old decay, and in some Countries are soone ripe after they spring, and will have ripe fruite, from fome of the plants at all times.

The Place and Time. This generally groweth in most Provinces of the East, as well Egipt and Syria, as the Indies; it groweth also in Braffill, but is planted onely in the Well Indies, in Cyprus also it will de e reaf mable well, but not fo in Candy, but in Spaine or Portugill, as I heare, it will not beare at all. Africa also and Ethiopia wanteth it not, and as is faid, hath ripe and greene fruite almost all the yeare long. The Names.

It is very probable that this plant was not knowne to The-ephraftus unlesse it be that which lib. 2 c. 8. he faith groweth in Cipius with a large leafe, and a much greater fruite, but is not favour v like the reft: and therefore . Guilandinus refuseth it, nor yet fince his time to Diefcorides or Galen, no nor to Pliny, unlesse as Clusius and others thinke, it may be his Pala, mentioned in his 12 Booke, and 6 Chapter, whose fruite was called Ariena, of a wonderfull sweetenesse, one whereof was able to fatisfie foure men, the leafe thereof being three cubits long and two broad, which is fom what like twin that as Garfia faith, it is yet to this day called Palan, in the Country of Malabor, which is on this fide Ganges, and beyond ludue: it is diver-

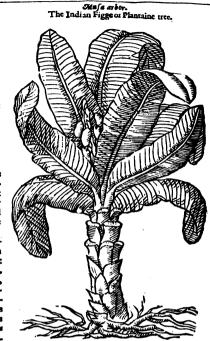

fly called, every Country almost, giving it a peculiar name, they of Malayo Pifan, they of Bengala Quelli, in other places of the Indies Melopalanda, in Malavaralfo Chincapalones, they of St. Thomas Island Abella: it is faid that some doe call one fort Senorins, and another Cadolyns, the Portugals call them Figos dorta and Figos de Cananor, others Ficus Martabana, of fome also Ficus Pha. raonis, they of Ginney, and in the Realme of Congo Bananas : Ludonicus Romanus, and Brocard, who wrote the description of the Holy Land call it Adams Apple, whom Cardania, and others doe follow, suppofing it to be the fruite that Eve tooke and gave to Adam: but the very text of the Scripture convinceth that errour, for it is there faid, that they fowed Figtree leaves together, to make them aprens to cover their nakednesse, when as one leafe hereof had beene fufficient. Some also as Baubinus setteth it downe, call it Dudaim, but I thinke that name better agreecth to the Mandrake. Of the Arabians Scrapio, and Avicen

Manz, Musa, Amusa and Ma-

um: of the Moores Muz, and

Gemez, of some Greekes and

Latines Margraita: they of

Muse a bort fra ?m. The fruite of the faid Indian Figge or Plantaine tree.

Profile call the tree Paquenere, and the fruite Paceva, O viedm and Acofia call it Platanes, for what cause is not sowne, unlesse the largenesse of the leaves enforced that title, but from thence I thinke hath risen the name of flowing whereby our English in all places call them by. The Italians, Spaniards, French, and others follow the latine name Masand so would J it should be called, or the Indian clusterfigge, to distinguish it from the other lats of Figges, that they be not confounded, but not Adams Apple as Gerard doth, from the superfitious concits of Brocard or others, for wee might as well follow that foolifh Francifcane that would tranferre it to the Miles, as gratefull to them. The Portugals have a conceit, that if this fruite be cut either thwart or aflore, there will appeare the forme of a croffe therein, and therefore they will not cut any, but breake them all that they nte, which vaine conceit it is likely they have taken from the Maronite Christians, as Lingboten saith. The Vertues.

It is generally held that no man ever tooke harme by eating the fruite hereof, onely by the much eating of them they have become loofe and foluble in their bodies, but that they comfort the heart and refresh the spirits: they realfo good for coughes, and hoarfeneffe, and to lenifie the sharpeneffe of humours, descending on the lungs; it iallo profitable for those whose urine is hot and sharpe, and to provoke it being stopped, stirring up also bodily hit; but they that have any feaver or ague must forbeare them, but are good for women with childe to nourish he birth: although this may feeme to be somewhat hard of digestion to weake bodyes and stomackes, yet to firring and able persons it is not so: the fruite being cut in the middle long wise, and dryed in the Sun, is then more delicate then a Figge: being baked in an oven, it is no leffe pleasant or boyled in broth, yet it will not alide any long boyling. The leaves being fort are commended to coole fuch as shall lye upon them, and keepe them temperate in the great heates a fome also with good effect apply the juyce of the leaves to places burnt with

CHAP. LXX.

Ficus Indian flipofus. The prickely Indian Figge.

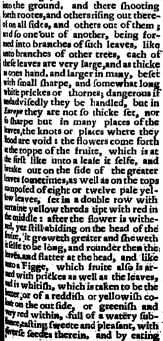

E have observed two forts of this Indian Figge, the one greater, not to be preserved a Winter in our Country without a great deale of care and conveniency for it, the other leffer, abiding reasonable well with us : they that fet forth the Pervan Hiftory, doe fay that there is two forts of wilde, one bearing no fruite, and another so prickely, that it serveth to no use, besides the manured which beareth the mine, but with thefe I must declare the breeding of the Cochenide, which is that graine which the Dyers use,

mis faid to be gathered from of these plants, or one of them.

I. Ficus Indicus spings major. The greater Indian Figge.

This greater Indian Figge groweth in some parts of the Welt Indies to have a body or trunke as bigge as ones sme or thigh, and from thence thooteth forth his leaves, but in other places, it groweth from a leafe first fet

forth rootes, and other srifting out there- 1,2. Firm Indica frinofa major wel minor. The greater or lefter prickely Indiau Figge.

TRIBE 16.

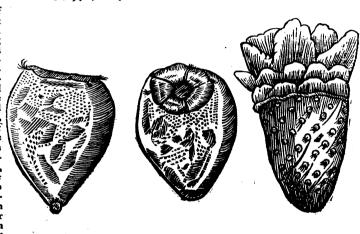

1498 them will cause the urine to be tincted like blood it selfe: the roote growegh neither deepe nor farterbroad.

2. Ficus Indicus finosus minor. The lesser prickely Indian Figge. This leffer Figge groweth more often with us, from leaves as farre as I can learne, yet J have knowne it rife

from the fowne feede, and never into a body or stocke like the former, and is in all the rest as like it as may be, with out any difference but onely the greatnesse, which in this is neither halfe so great or thicke, or the growth with out any difference out onerly the greatest the state of the growth halfe so high, and this declaration may be sufficient to describe it by comparing the former discourse herewith that I doe not make a double repetition of one thing. 3. Cochenille five Fici Indici grana. The Dyers graine called Cochenille.

There hath beene much doubt and many variable opinions, concerning the breeding of the Cochenille, some taking it to be the Coccognidium verum, others to be the Chermes Arabum, and that it differeth not from the Coccus Baphicus of the Grecians. Fragofus would feeme to know more then others, and in his third Booke and re. Fici ejufdem Ind ei fruttis. The fruite of either of the Indian Figgetrees.

Chapter, faith that they are certaine graines that grow in Peru, at the rootes of certaine imall plants, that are like unto the common Burner Saxifrage, cleaving to the rootes of it like wild Graves, but is utterly erronious for Peru, his opinion as it feemeth being taken from Anguilara, and Lacana who fay that there are certaine graines found in Cme places here with us, growing on the rootes of the Burnet Saxifrage, whose inner pulpe doth give a crimfon dye, and is therefore called Coccus radicum, that is, the roote graine: some have taken them to be flyes, or fuch like covered with a small thin skin or case, and sticking under the leaves of this Indian Figge: but Ioannes de Laet of Antwerpe, in his fifth Booke and third Chapter.

page 229. of his description of the West Indies, she wethus the truth hereof more exactly then O vieden or many other that have written thereof I thinke, and faith that befides the two wild forts, whereof one giveth no fruite and the other to prickely that it is of no use, and the tame or manured fort that beareth fruite that is very sweete and of a most pleasant taste, and either white which is esteemed the best, or red or purple, which dyeth the hands with a blooddy colour, even as Mulberryes will doe, and being eaten coloureth the urine also into the same blooddy colour. There is faith he another fort, called by the Indians Nochezeli Nopalli, or Nopall Nochezeli which although it beareth not such like fruite, yet it is more accounted of, and husbanded with more care and diligence because it beareth that precious graine Cochinille, so called by the Spaniards, as a diminitive from the Coccus of the auncients, so much sought after, and used by Dyers, for the excellency of the colour : This plant loveth those places that are temperate : Herrera describeth the manuring and ordering thereof, and de Laet from him in this manner: The graine Cochenitle is bred on the tree, which is called Tana, in very many of the Countries of the West Indies, and new Spaine, which hath most thicke leaves, whereby it is encreased in those places that are open, and yet defended from the North : It is a living creature, or rather a kinde of Infect or flye, not much differing, but comming necre unto a punie or wall loufe, being fomewhat leffe then a flea, when it first getteth to the plant, and bred from a feed no bigger then an hand worme, and doe so loade the trees, and fill the whole Garden, that they must gather them twice every yeare from the trees, which they fet in order and tend like their Vines, and free them from weedes, or what else may have them: the younger the trees be, the more plentifully will they beare, and the better graine, but especially it is secretary for them to cleare them from the other forts of flyes, and no lesse keepe away their hens, who will devoure the graine: and to cleare their trees from the encrease of these other forts of five they use Foxetailes, and when they are growne full ripe, they gather them with great care, and kill them by eafting cold water on them, and dry them in the fhaddow, and keepe them in pots: some kill them by calting after among them, and afterwards wash them, and others choke or kill them by some other wayes; but it is the best way to kill them with cold water. But now this graine is adulterated By the Merchants, aftet divers manners; for there are foure forts to be found hereof: the one giveth a colour of no great worth as being a wilde fore and not manused: another is blacker, which groweth also of it selfe, without care or husbandry, a third is a moantainous fort called Chichimeea, and of a meaner regard, all which they mingle together with the fourth, that is the best and manured. The divers forts hereof among the Merchants have severall names, according as the Spaniards call them: every fort according to the goodnesse hath a name whereby they know it, as Situafier and Tankeliobe, the two worst forts, being of a blacke dull colour, yet the largest graine. Musteke is a gray fort, and is the most ordinary we have, but the Gelbaca, is in colour betweene both, in fife no bigger, but in goodnesse much excelleth them all, and is not much inferiour to the Refetta, which is

be reddelt in shew, and the richest in use of all. And Tlaxcala giveth the best fort of graine by far, Franciscus Ziwriteth that this plant bringeth forth a certaine gumme, which doth temper the heate of the reines, and of the urine, and that the juyce or water distilled from it, is a wonderfull remedy against pestilential and chollericke levers. The Chochenille or graine it selfe is held to be very cordiall, and to drive infection from the heart. for is familiarly given both to the infected with Plague, Small poxes, or other infections or dingerous sickeælfe.

The Place and Time.

Both these forts grow in the West Indies, the greater fort all the Indies over, from Florida, and the other on misside it, where the greater is not found, as being a colder Country then that the greater can live in it, and howreth with us about the end of May, or in Inne, and the fruite ripeneth not with us kindly at all, but abideth mill the Winter, and the next Summer too, and yet will be greene on the outlide, and waterish or unfavoure. shough somewhat reddish within, but more red within than without, and sweete also in the naturall places. The Names.

Divers Authours have given divers names unto these plants, for Matthiolus, Dodonaus, Lacuna, Lobel, Cafaloiand others call it, Ficus Indica, divers of the Indians that be Islanders call it Tuna or Tunal, they of Mexico ad thereabout Nochrli, and as I shewed before Nochezeli Nopalli or Nopall Nochezeli, and in some places also ladi, but that I thinke is by the Spaniards, and thereupon it was called Cardam Indiam, and Ficm India: diverse ditake it to be the Opuntia of The phrastus and Pliny, but erroniously, for they beth say, it is an herbe sit and specte to be eaten, but the leaves of these are not used to be eaten, neither is it an herbe or plant, naturall to any ofthe nations of Europe, Africke or Afia but a peculiar kinde of it felfe; but Opuntia is an herbe growing natunlly about Opans, and is usually eaten, and therefore this cannot be it but another herbe, as I have shewed in the Cupter of Opantia marina, among the Sea plants: fome also call it Pala arbor Plini, as Bellonium and Anapallus ilo; The lefter fort is called by Lobel Indorum ferrum; natrix, and Opuntia Officeollos, and by Banhinus Fiem In. kafolio (pinoso fructu minore. The Vertues.

It is faid that the Indians use to lay these leaves bruised upon places that are put out of joynt, or the snewes or ameryes over stretched, and to helpe those that are bursten or broken to knit up the places againe: the juyce of beleaves is with good successe used in foule ulcers or sores: The vertues of the graine are set downe a little beme at the end of the declaration thereof.

CHAP, LXXI.

Ficus Indica arenata. The arched Indian Figge tree.

His admirable tree for so it is called by many, groweth to be a great tree, and tall, spreading many armes all about. and very long which by reason of the slendernesse and length, bend downe

witheground, shooting forth, certaine yellowish fringes at their ends, which as soone as they come tothe ground, doe thereinto thrust themselves as frongly as the first, which againe send forth other banches after a while that they are well growne in befame manner as the first, for they also in time gow great, and spread their branches, which likewisebending downe take roote againe, and thus sceffively one after another, untill it hath taken up a great compasse of ground, even a mile as it is hid in compasse, and made as it were a Grove or Wood from that one first tree, whereunder the Indians doe shelter themselves from the heate of the Sunne, and so prune away the under boughes, and branches that they make divers walkes and crosse wayes through these trees, leaving their branches wer head as arches to passe under to and fro, and tutting out some looke holes as it were, to give light and ayre to a thousand men, and more that may be sheltered under the shaddow of this one tree, with the Suckers thereof, among fo many of whom it is hard to finde out the originall or mother locke, the leaves on the young branches are like anto Quince tree leaves, greene on the upper fide, and hoary white like them underneath, wherewith Elephants are much delighted to feede, and whose branches they cut downe to give them: the fruite groweth among the branches no bigger then the end of ones thumbe, but fashioned like a Figge of

Ficus Indica Arenata. The arched Indian Figge tree.

Mmmmmm 2

blood red colour both within and without, somewhat sweete like unto them, but not so pleasant. The Place and Time.

This tree groweth in divers places of the East Indies, as at Goa, Malacca, &c. and abideth alwayse greene. giving ripe fruite at the time with others in that Country. The Names.

This tree is mentioned first by Q. Curtius, lib. 9. who wrote the acts of Alexander, in his warres into the Indies, and by Theophrastus also lib. 4. c. 5. who lived neere that time, and calleth it Ficus Indica, as Pliny also lib. 12.6.5. after him doth: Strabe also although hee gave it no name then, or of the admirable tree, vet hereby you may perceive that it is no new found tree in these later dayes, but knowne and written of by the Ancients. Goropius Would draw this tree into Paradile, and make it the tree of the knowledge of good and evillathar God had planted in the midst thereof, and forbad Adam the eating, and of which by eating, he brought a woe on himselse and his posterity, so bold is he to take upon him to know that which he hath no authority or proofe for. but onely led by fansie and strong conceit, about the river Acesine, in those parts where this groweth, and therefore Paradice must needs be there also. The Portugals call it Arbor de ray, that is the tree of rootes, and thereupon Linschate in his Booke figureth a tree with a number of rootes thereto, rather out of fancy then fight which Clufius misliked. Some doc call it Arbor Goz, but of most Ficus Indica, and I have added arcuata for a difference from others.

The Vertues.

The fruite is good and wholesome to be eaten, but I cannot learne if ever it was applyed to cure any wound or ulcer in the body, or uled in Phylicke, for any difeale.

CHAP. LXXII.

Paris. The Peare tree.

Ecause Peares are so like unto Figges in the outward forme of them, I thinke good to joyne them next thereunto, whereof there is both manured and wilde : the manured doe transforme themselves into so many severall fashions, colours, and tastes, that it would take up many leaves to describe them at large as they might be, for not onely every Country abroad, and beyond the Seas, have severall forts, which we never saw or heard of but in our owne Land also, there are so many that it is almost impossible that they should all come to one mans certaine and perticular know-

ledge (yet have I shewed you a many of them in my Orchard heretofore.) Of the wild forts likewile there are

. 1. Pyrus failes. The manured Peare tree.

2. Pyrm fiveftru. The wilde or Choke Peare tree.

both abroad and at homefuch variety, that a man might frend his whole time thoroughly to observe and set downe all the forts that are knowne in other places. I will therefore endeavour but to shew you here a generall description of the tree, both rame and wilde, with some forts that are not expressed in my former Booke. 1. Pyrus fativa. The manused Peare tree.

The manured Peare in generall groweth higher, but flower then the Apple tree, more upright also and not foreading the branches, and no leffe thicke, but rather greater in the bulke or body: the leaves are somewhat broade and rounder, greene above and whiter underneath then those of the Apple tree: the flowers are imaller but whiter then the Apple bloffomes, and the finite more long then round for the most part, finaller also at the stalke, and greater at the head, of many differing fashions, sizes, colours, and tastes, and times both in gathering and spending, fome being greene, fome ruffer, other yellowish or reddish, fome great, others small, or long, or round, or mouth, or bunched out, and fo for taftes also, iweetish or lushious, or delicate or waterish, or hard and firme, and well rellished, or not so good to be eaten raw, as baked or roafted, and some to be spent as soone as they are gathered, or foone after, being Summer fruite, others not to be fpent untill the Winter te either come in, or neere of fully past; each particular to every fruite we e too tedious: for this Worke being growne already so voluminous, and feeing I have frewed them in part elsewhere: The wood is smooth close and firme, and serveth for many uses, both for formes to cut these figures or the like in, and instead of wainscot in many poore mens houses. and for many other purpoles. 2. Pyrus (ylvestris. The Wilde or Choake Peare tree.

The wilde Peare tree usually groweth tall and upright, like the manured kinde, and as little spreading, but fometimes low and crooked, but fuller of branches, which maketh them the more knotty, the barke is blacker and more rugged, cleaving also in many places, and easily to be pulled off; with prickes and thornes set here and there on them, but not so thicke as in the Crab, the leaves and flowers doe little vary, but that some will have larger and others lesser leaves and flowers, which will also be a little deeper coloured then others, as the fruite being greater or smaller, and of a more or lesse harsh talte, although all have some, and the colour likewise in some is greene or darke russet, and some will be so faire, yellow and red, that they would invite any that seeth them and howeth them not to take and talte of them, which then are to different from their expectations, being harsh and unlavoury, that they presently out with their purses and bestow this adage there on, Non est semper fides habenda fonti: yet this harsh unsavoury fruite, though later ripe then most of the manured fortes, by being in part mellowed with the Autumnes coldes, and the standing of their juyce being pressed forth and made into Perry, doth intime fo alter his former quality of harshnesse and uniavourinesse, that it becommeth fully as cleere, and almost spleasant as white wine: the wood hereof is harder, firmer, and closer then the former, and so more knotry alb, whereby it becommeth more frangible and fooner broken.

Of the manured Peares there is a fort that although it be a good Winter fruite, tweete and well rellished, especally if they be stewed or baked, yet the tree hath thornes upon it, like unto the wild fort, this was brought as it /pinosa Baid from Naples into Lyons, where it is plenty, and called Poirier d' espine, and the fruite Poire espine, that is, sativa.

Pyrus fativa spinosa, the prickely Peare. The winged Peare hath a leafe alwayes, or two sometimes, growing to the sides of it, as if it came out of the Peare, and may therefore be called *Pyrophila*, whereof *Gamerarius*, speaketh in horto.

The Pome-peare, or Apple-peare, which is a small Peare, but round at both ends like an Apple, yet the tree is a foliara.

The Blood Peare, whose inside is red, as the outside is. Camerarius in horto maketh mention hereof likewise. The Laxative Peare which loofeneth the belly being eaten. Camerarius there also haththis.

The double bloffomed Peare. This bore double flowers with Master Ward, of the Kings Granary, but whether Prius

itealive or dead, I am not affured; nor whether it kept the forme, or did alter. Laxativa Pyrus flo-Pyrm fylveftru. The wilde Peare tree. 1. Of the wilde kinde there are the great red Choke Peare, whose colour and property, I have shewed you in reduplies.

the description.

2. The imaller Choke Peare.

3. The Hedge Peare.
4. The lowfie Hedge Peare.

5. The Crow wild Peare.

6,7. Wild Peares of Candy, the one they call Achlades, the other Agasaga, as Bellonius saith The Place and Time.

The manured forts are onely planted and preserved in Orchards for the purpose, the wilde forts being some found in our owne Woods, and planted in the Hedge-rowes of fieldes, to fave the ground of their growing, and yet have as much use of them as by being abroad, the wild flowring and ripening their fruite later then the ma-The Names

The manured Peare is called in Greeke an G., and in Latine Pirm, and Pyrm a fruttus figura quod ad Pyramidalu fimilitudinem, elato in mucronem turbinetur : The wild Peare is called d'xess in Greeke, by Theophraftus, a privativo non, quod non sit in usu fruttus ejus ad kumanum corpus, yet Dioscorides saith, a'xeis is a kind of wilde Petre of it selfe, and oxin, in Latine Pirus stronger, and Pyraster, or Piraster: all peaceable ages have beene much delighted with the variety of all forts of edible fruites, and therefore Cato, Columella, and others, but especially Play hath let downe the names of a number, as they were well knowne in his time which how our age can panliell ours unto them, I cannot tell; yet Lugdanen fit hath in fome fort endeavoured it to his French names, but how truely I know not, nor is it greatly materiall for us to doe, because names are often given from the place where they belt grow, or from the person that first brought them into their Country, or was much delighted with them, or from some other cause or accident, which names are not so fit for one Country as another : Wee have so many in Owne Land, that I never knew any one that could be possessed of all forts, although they strove to doe it as much as in them lay, for still they were informed of some they had not : And I have declared a many of them in my former Booke. The Arabians call it Humosibbo, Cirmetro, and Kometri, the Italians Peresthe Spaniards Pyras, the French Poires, the Germanes Bir Biren, and Piren, the Dutch Berre, and we Peare.

Pyrus

fanguinea

The Theater of Plants.

The Vertues.

Peares of any good or reasonable rellish are more spent for meate then medicine, and most of them eaten raw at severall times as they be fittelt to spend, or else stewed or baked, as the kinde doth best fate, and every one list to use them; the forts also that are fittest for the purpose are dryed in ovens to keepe all the years, being an excellent repaste: some are preserved in Sugar, as other fruites are, and served in banquets among other sweet meater. or dryed up after they are preferred and so put among other dry candid Innekets. The Warden is chiefly, yea onely admitted to be taken by the sicke, and aguish in that it hath no actriction therein to breede obstructions. which are the utter enemies to putrid feavers. The wilde Peares by reason of their harshnesse, are not eaten as the milder forts are, except some good kinde stewed or baked, to serve the poore peoples dyet, the other scarse fit for the hogs to eate, and therefore are for the most part where store of them grow, beaten and pressed into a liquour which is called Perry, of especiall good use at Sea in long voyages, to mingle with their fresh water, to make it the more healthfull, or lesse offensive to those that must continually drinke water: and will after some time become to milde almost as Wine, and fit and wholesome to be drunke: The Physicall uses of them both are these: They are to be discerned best by their tastes, for according to Galens rule, the harsh or sowre doe coole and binde, the sweete doe nowish and warme, and those that are neither much sweete or sowre, but betweene both, have answerable qualities to their degrees: all the fweete or lushious forts doe helpe to moove the belly downewards more or leffe, but that fore much more, which hath the name of the Laxative Peare: those that are harsh or sowre, doe on the contrary part binde the belly as much, and the leaves doe so also: those that are moist doe in some fort coole, but the harsh or wilde sorts much more, and serve well to use in all causes. where there is neede of repelling medicines, and if the wild forts be boyled with Mushromes, it maketh them the lesse dangerous, and it is faid alto that the aftes of the Peare tree wood being taken in drinke, or the lye of them being drunk, doth helpe them that are like to be choked with eating Mushromes: The faid Peares boyled with a little hony doth help the stomack very much, that hath any paines or oppression therein, all forts of them somemore or lesse, but the harsher forts doe nost coole and binde outwardly applyed: and serve well to be bound to greene wounds to coole and that the blood, and to helpe to heale up the wound without inflammation or further trouble : Which cour le Galen himselte as he saith was driven to use upon an exegent not having any other thing at hand for the purpose: Wild Peares therefore in the like case doe more close up the lippes of greene wounds then the other. Perry is a drinke that whosever useth at home being not accustomed to it, will wring them a little by the belly, and will a little force it downeward, but being more used it worketh not so at all, but rather cooleth an hot or fainting ftomacke, helping the digestion being temperately taken: but at Sea by the working thereof it is made more comfortable, taking away the crudity and rawnesse of the water.

CHAP. LXXIII.

Malus. The Apple tree?

He Apple likewise is divided into tame or manured, and wilde, the one serving for Orchards, to be tended and regarded, the other to be left to the Woods and Hedge rowes of fieldes, &c. as I did therefore with Peares in the former Chapter fo I meane to deale with Apples in this, give you a generall description both of tame and wilde, and the other forts, that is, especially the Wildings or Crabbes,

which were not mentioned in my former Booke.

1. Malu vulgari. The common Apple tree.

The Apple tree in generall spreadeth his armes and branches more then the Peare tree, but riseth not to that height, the leaves are formewhat round, a little long pointed towards the ends of them, and dented about the edges greene both above and below: the flowers white and a little blush coloured about the edges, consisting of five leaves, the fruite that followeth in this as in the former, is of divers fizes, formes, colours, and taftes, and likewife of variable ripening and latting, for some will be rotten before others be ripe, and some must be spent, before others be gathered.

The double b'offormed Apple different from the former in nothing, but in the flowers, which are double, and

Flore duili- that it beareth no fruite.

2. Malus sylvestrie, The Wilding or Crabbe tree.

The Crabbe groweth somewhat like the Apple tree, but full of thornes, and thicker of branches. the flowers are alike, but the fruite is generally small and very fower, yet some more then others, which the Country people to amend, doe usually rost them at the fire, and make thom their Winters junckets: whereof fome are redder or whiter, or greener, or yellower then others, being feldome much regarded, or diftinguished more then to make Cyder or Verdjuyce of all forts being indifferently put together.

3. Chama malw. The dwarfe or Paradife Apple.

The Paradife Apple is also a kinde of wilde Apple, yet no tries, for it is not grafted like the manured forts, for it as the Crab, rifeth without grafting to be a tree of low stature, not much higher then a man may reach, habiting leaves and sources like the formatting to be a tree of low stature. ving leaves and flowers like the former the fruit is of a reatonable fize, faire and yellowish, but light and spongy, of a bitter (weet tafte, not pleasant, and will not last long but quickely shrinke and wither: the body and branthes are much subject to the Canker, which will quickely eate it round and kill it, and besides will have many feabby bunches that deforme it and cause it to perish, and this as it groweth elder, for it is full of suckers, from the roote, which will be as faire and fmoth, as of any other tree.

Of the manured fort there is one whole flowers are wholly white & smaller, the tree lower and the fruit smaller.

There is another which hath no kernels within the core.

Of the manured kinde, the Holland Pippin must be remembred, which is a flat and yellowish greene Pippin, and of as good a rellish as most of the other Pippins, and of a meane size. Of Wildings or Crabs, there is the Towne Crab, the greater and lesser red Crab, the greater and lesser white Crab, and the small hedge Crabbe.

Malus wheeltris. The Wilding or Crabbe tree,

The Place and Time.

The Petter forts of Apples are planted in Orchards, and some of the other, as the dwarfe kinde, the Wildings or Crabs grow in Woods generally, yet are planted in the hedges in many Countries of this Land to make Cyder withall, the Applesin generall flower, and bud forth leaves later then Peares, and ripen earlier or later for The Names. the most parr, according to the kinde.

ne most part, according to the kinde.

It is called in Greeke μπλία, and the fruite μῆλου, in Latine Malsu and Malsum, or Pomus and Pomum, yet Pomum is a generall word including the fruites of many other trees, for fome would diftinguish all forts of fruites into Pomum and Nacem, but Sealiger faith the opinion of those Grammarians is too ridiculous : it is therefore ufully called Malm, but yet that word likewife is referred to divers other kindes of trees, as Malm Cydoma five Cotonea, Malm Medicavel Citria, Malm Limonia, Malm Auras sen Aurantia, Malm Persita, Malm Punica, Malm Arminiaca vel pracocia, and many others, and Pliny numbreth Zizypha, and Tuberes among them, who retitth the names of a number of forts frequent with them, as he doth every where with other forts of fruites, which to relate here were impertinent, especially tous, who can apply but very few of them to those forts are knowne among us, and to fave time to frend to better purpole. Cornarisa taketh the Caffiana mala which Coluwild calleth Sessians, to be the Arantia Orenge: but Galen appointing the Castiana mala to be boyled, to give one for the head ache, did not meane the Orenge, which was neither knowne to him or in his time, nor yet is used to be boyled. The Arabians call it I'msa and Insalia, the Italians Mele, the Spaniards Mansanas, the French Pomer and Pomes, the Germanes Depstell and Apstell, the Dutch Appel, and we Apple. The l'ertues.

Apples in generall are cold and windy, and being of fundry tastes, Galen sheweth thereby how to diftinguish them, for some have an austere talte, and are good for fainting stomackes and loose bellyes, others sowre good to cool and quench thirst, and some sharpe, fir to cut grosse slegme, some sweets soone distributed in the body, and a quelch train, and some marpe, it to the grone negme, some I weete 100ne ditributed in the body, and as quickly passed away, yet some corrupting in the stomacke if they be stayed: the best forts before they be thorough ripe, are to be awoyded, then to be rolled or scalded is the best way to take them, and a little spice or fedes mixed or east upon them, and taken after meate, doe streagthen both stomacke and bowels, especially in those that either loathe their meate or hardly digest it, and for those that are given to casting, or have a flixe or laske; those that are nor sweete, but rather a little fowre or harsh, used in that manner are fittelt; Sweete Apples doe loosen the belly, and thereby drive forth the wormer that are therein: fower Apples doe loosen the belly, and thereby drive forth the wormer that are therein: fower Apples floppe the belly, and provoke vrine; Crabs for this purpose are the fittest: The sweete Apples, as the Pippin and Pearemaine helpe to dissolve Melancholly humours, to procure mirth and expell heavinesse, and there for are fittest for Confessio Albermes, and Sympus de pomis. The leaves boyled and given to drinke in hot agres, and where the heate of the liver and fromacke caufeth the lippes to breake out, and the throate to grow dry barth and farred, isvery good to wath and gargle it withall, and to drinke downe tome; this may to good

Pamanana.

pursole be used, when better things are not at hand, or cannot be had: the juyce of Crabs, eyther Verdjuyce or Cider is of fingular good use in the heate and faintings of the stomacke, and against casting, to make a posset with fome of it, and drinke, or take some thereof by it selfe: Cider is not onely called in the North Country Wine by those beyond Seas, but is used almost as wine in divers Countries of this Land where it is made, and as I said of Perry before, to a stomacke unacquainted with it, it will be somewhat troublesome thereto, and to the belly. ver by the often use of it, it becommeth familiar and helpefull to those that have fainting or weakenesse of the spitits and stomacke, somewhat comforting and refreshing the vitall Spirits; it is of great use at Sea in long voyages, and is more defired then Perry. The juyce of Crabs or Cider applyed with wet clothes therein, to icalded or burnt places cooleth, healeth, and draweth forth the fire: a rotten Apple applyed to eyes that are blood fhotten, or enflamed with heate, or that are blacke and blew about them by any stroke or fall, and bound to all day, or all night helpeth them quickely : the distitled water of rotten Apples doth coole the heate and inflammations of fores, and is good to bathe foule and creeping ulcers, and to wash the face to take away spots, freckles, or other discolourings in the face, the destilled water of good and sound Apples, is of speciall good use to procure marth and expe I melancholly; the oyntment called Pomatum if it be sweete and well made doth helpe the chaps in the lips or hands, or to smooth the rough skinne of the hands or face, parched with winde or other accident, to supple and make them smooth.

CHAP. LXXIV.

Malus Cydonia. The Quince tree.

Here are foure or five forts of Quinces knowne to us in these dayes, which are as solloweth. 1. Malus Cotonea vulgaris. Our ordinary Quince tree.

The ordinary Onince tree groweth oftentimes to the height and bigneffe of a reasonable Appletree, but more nitually lower and crooked, with a rough barke, spreading armes and branches tarre abroad: the leaves are somewhat round and like those of the Apple tree, but thicker, harder, fuller of veines, and white on the underfide, not dented at all about the edges: the flowers

are large and white, tometimes dasht over with a blush : the fruite that followeth is yellow, being neere to be ripe; and covered with a white freeze or Cotton, thicke fet on the younger, and growing leffe, as they grow to be thorough ripe, bunched out oftentimes in some places, some being liker an Apple, and some a Peare, of a ftrong heady fent, and not durable to keepe, and is fowre, harsh, and of an unpleasant raste, to eate fresh, but being scalded, rosted; baked, or preserved becom-Maim Cotones vulga is. meth very pleasant.

2. Cydonia Lusitanica. The Portugall Quince.

The onely difference in this is in the fruite, which is of two forts, the Apple Quince is great and yellow, feldome comming to be whole or feene without chapping, it is so pleasant being fresh gathered that it may be eaten like an Apple without effence, but dreffed after any the wayes aforefaid, it is much more pleasant: the peare Quince is like the other, but not fit to be eaten raw like the former, but must bee prepared after some of the wayes before let downe, and so it will take up lesse Sugar then the English because it is pleasant of it selfe.

3. Cydonia Barbarica. The Barbary Quince.

This is like unto the last in goodnesse and pleafantnesse, but lesser in bignesse, not cleaving at all.

The Lyons Quince is a reasonable great Quince. Luglanen- like the English, but not so yellow as the Portingall

The Brunswicke Quince is almost round, neither

like peare nor Apple.

7 he Place and Time.

CH A P.74.

1504

The first is our English Quince, that best likes to grow neere ponds and water fides, and is frequent through the Land, the other have their places expressed in their titles : and slower not untill after the leaves be come forth; the fruite being ripe of the Portugall and Barbary, about the middle of September usually, the other later by a moneth,

The Names. It is called in Greeke unnéantidure, and in Latine Malus Cydonia, a Cydone Crete oppido diciem unde prima advetta latth Pliny Cato first called it Cotonea Malus, and Pliny after him; Diefcorides and Gales have but two forts, the one small and round, and the other greater but leffe ulefull, called Struthia, The ordinary Quince tree.

which as Galen faith is focalled in Afia, Columella fetteth downe three forts, Struthia great ones, Chrysomela gold colour, and Muften earely ones, but little. Virgill in his third Ecclog. calleth the Chrysomela a wild fore in thefe Verfes.

Onod potus. (vivestri ex arbore letta Aurea mala decemmist, cras altera mittam.

But Pliny hath erred very much in faying that the Strutbiaor Strutbiomela, are small, contrary to Dioscorides Galen, and Columella. The Arabians call it Saffargel, the Italians Melocotogno, the Speniards Membrillio, and Marmello, and from thence is our Marmelate of Quinces called Marmelades, the French Coing, and Pomme de ting, the Germanes Kussen Quitsenbaum, and the fruite Kuttenopffell, the Dutch Queboom and Queappel, and we Oniscetree, and Quince.

The Vertnes. Quinces have a cold and earthy faculty in them, and by the reason of their great binding, they moisten the body lefe then other fruites, for they are cold in the first, and dry in the second degree : they are acceptable to the formacke, but much more baked, rofted, or fealded then other wife: yet when they are greene they helpe all forts offlixes in man or woman, and chollericke laskes, caltings, and what foever needeth altriction, more then any way nepared by fire, yet the Syrupe of the juyce, or the conterve, is somewhat conducible for much of the binding quality is confirmed by the fire: if a little vinegar be added, it stirreth up the languishing appetite, and the stomacke given to casting, and if some spices it comforteth and strengtheneth the decaying and fainting spirits, and helpeth the liver opprest, that it cannot perfect the digestion, and correcteth chollour and slegme : if you would have them purging, put honey to them in stead of Sugar, and if more laxative adde for chollour Rubarbe, for flegme Turbith, for watery humours Scamony: but if more forcibly to binde, use the unripe Quinces with Rois and Acacia, or Hypocifibia, and some torrested Rubarbe: To take of the crude juyce of Quinces is held a prefervative against the force of deadly poyson, not suffering it to have any force in the body, for it hath beene often found most certaine true, that the very finell of a Quince hath taken away all the strength of the poyson of Ellibriu albii, which Hunters make to kill wild beafts, by dipping their Arrow heads therein: it hath beene allo found certaine, that if Quinces be brought into a house where Grapes are hung up to be kept dry all the vere, they will affuredly rot with the very smell of them: If there be neede of any outward binding and cooing of any hot fluxes, the oyle of Quinces, or the other medicines that may be made thereof, are very availeable mannoynt the belly or the other parts therewith, it likewise strengtheneth the stomacke and belly, and the sinues that are loofened by fharpe humours falling on them, and reftraineth immoderate (weatings : the maccilage riker from the feeds of Quinces, boyled a little in water, is very good to coole the heate, heale the fore breafts of women. who have them fore by their childrens default or otherwise: the same also with a little Sugar is good to mefic the harfhneffe and hoarfeneffe of the throate, and roughneffe of the tongue: the cotton or downe of Quinces boyled in Wine and applyed to plague fores, healeth them up, and laid as a plaister made up with waxe, itbringeth haire to them that are bald, and keepeth it from falling, if it be ready to fhed.

CHAP. LXXV.

Malan Medica vel Citria. The Pomecitron tree.

TR 188 16.

though diverse have used this word of Malsu Medica, to comprehend under it all the other kindes of Leinmons and Orrenges, yet I meane to diffinguish them severally, and take it but for one kinde, which as the most principall, I will set in the first place and the rest to follow, whereof there hath beene observed in divers Countries, divers varieties, and their names set downe by fundry Authours, which how they doe agree together I cannot tell, fo few of them having beene feene in our Land. I will therefore here shew you those few that Clufius hath set downe, with some others of our owne observation.

1. Malm Citriamajor. The greater Pomecitron tree.

The greater Citron tree groweth not very high, in some places but with a short crooked body, but in others not much lower then the Lemmon tree, spreading fundry great long armes and branches set with long and sharpe thornes, and faire large, and broad fresh greene leaves a little dented about the edges, with a shew of almost invifible holes in them, but leffe then the Orenge leaves have, of a very sweete seat, the flowers grow at the leaves all along the branches, being somewhat longer then those of the Orrenge, made of five thicke, whitish, purple a blush leaves with some threds in the middle, after which all the yeare long followeth fruite, for it is seldome stene without ripe fruite, and halfe ripe, and small, young and greene, and blossomes all at once : This kind beaith great and large fruite, fome as great as a Muske Melon, yet others leffer, but all of them with a rugged, bunbed out, and uneven yellow barke, thicker then in any of the other forte, and with finall flore of fowre juyce in the middle, and somewhat great pale whitish or yellow seede with a bitter kernell lying in it, the smell of this Apple is very ftrong, but very comfortable to the fenfes. 2. Citria malus minor five Limonera, The leffer Pomecitron tree.

This leffer Citron tree groweth very like the former, but the leaves are somewhat leffer and shorter, and so with thornes also. The flowers are of a deepe bluth colour, and the fruite leffer and longer then they, and no bigger then the leffer fruite of the former the rinde allo reafonable thicke and yellow, but not to rugged, having more flore of fowre juyce within them, and fewer feeder.

This different not in the tree or any part thereof from the last, but in the fruite, which is as great as the last, and thick palet yellow on the outfide, having another smaller fruite growing within it lying at the very top or head. It not to be seene before you cut it, and is divided from the other fruite with a yellow rinde, covering the most at of it, and flicking onely to the other at the head or toppe, the greater fruite hath both juyce and feede within that the lefter bath no feedes, and but little or no juyce, and is more fweete then fowers the Spaniards call it Li-4. Limomes prennados.

TRIB . 16.

4. Limonera dulcia. Sweete Limoones or Limerones.

In the fruit of this tree which the Spaniards as Clusius faith call Limones del Emperador, is the greatest difference from the last, which is smaller then it, but twice as big as a great Lemmon, of a deeper yellow coloured barke, and thinner by much, being full of juyce, but sweete

and pleasant and may be familiarly eaten, with the rinde and all.

CHAP.75,

5. Limonera acida.
Sowre Limoones, or Limerones.
This fowre Limoone is very like this laft, but fomewhat bigger, more yellow rinded, and fomewhat rugged, the juyce whereof is more lower then it, yet lesser then of a Lemmon. 6. Liminera multiformis.

Changeable Limoones or Limerones. The fruite hereof is wholly neere unto a flesh colour, and of divers formes, some being of one and some of another fashion, not constant in any; the Spaniards call it Limones de figuras.

The Place and Time. All these forts of Citrons grow in Spaine, with those that are curious, to nourse up rare fruites, but gained from fundry places abroad; and the lift from the fortunate Islands. Their time is without time, even all the yeare throughout, flowring and bearing fruite.

The Names.

The first and great Pomecitron, is called in Greeke undia undian, that is, Malu medica, Theoph-aftes faith lib. 1. c.4. that it came first from Media and Perfis, and therefore was called Malum Medicum and Perficum, and foine have called it Malum Affyrium, others Malum Citrium or Citreum, as also Oedromela, and Citromela, and Citrangula: some also call it Citrus arbor, and some Cedrus Theophrasti & Dioscoridie, and some Poncires quasi Pomacitria. And the second is called by Cluftus Limonera, as he faith the

Spaniards to call the tree, and the fruite Limones, as they doe the rest that follow, with their other severall denominations, because both tree and fruite differ from the first or true Citron, which they call Gidras, the Italians Cedri, and Citroni, the French Citrons, the Germanes Citrinoepffell, the Dutch Citroen, and Citreenboom, and we in English the Citron, or Pomecitron tree or fruite.

The Vertues. All the parts of this fruite both the outer and inner rinde, both juyce and feed are of excellent ule, and of contrary effects one unto another, as fome hot and dry, others cold and dry: the outer yellow rinde is very sweete in finell, very aromaticall and bitter in taile: and dryed is a very foveraigne cordiall for the heart: and an excellent antidote against venome and poyson, against the plague or any other insections it warmeth and comforteth a cold or windy flomacke, mightily diffolving the winde, and dispersing raw cold and undigested humours therein, or in the bowels: being chewed in the mouth it amendeth an evill breath, and caufeth a good one: it also helpeth digestion, and is good against melancholly: these outer rindes being preserved with Sugar, are used as a junket, more then in any physical manner, yet are they often used in cordiall electuaries, preservatives against infection and melancholly, and other the diseases aforesaid. It also helpeth to loosen the body, and therefore there is a solitive electuary made thereof called Elettuarium de Citro solutivum, to evacuate the bodyes, or cold flegmaticke constitutions, and may be also safely used where choller is also mixed with flegme. The inner white rinde of the fruite is almost unsavoury and without taste, and is not used in any manner of physicke, but being preserved serveth to fort with other Suckets at banquets; the sowre juyce in the middle is cold and sarre surpasseth that of Lemons in the effects, although not so sharpe in taste : it is singular good in all pestilentiall and burning feavers, to restraine the venome and infection, to suppresse the violence of challer, and hat distemper of the blood, and extinguish this it, and correcteth the ill disposition of the Liver, stirreth up an appetite, and refresheth the overspent and fainting spirits; resisteth drunkennesse, and helpeth the turnings of the Braine by the hot vapours arising thereinto, and causing a frensie or want of sleepe: the seede is the last to be spoken of, but not of the least property, for it not onely equalleth the barke, but surpasseth it in many particulars, although Galen and Avicen seeme herein to be opposite one unto another. Galen maketh the seede to be cold, which Matthiola would excuse with diverting his intent to the juyer; and Avicen saying it is not in the first degree, and dry in the second; the barke or rinde, not in the first, and dry in the end of the second degree, the inner white substance being betweene the outer barke and the inner juyce, hot and moilt in the first degree, and the acide juyce cold and dry in the third degree : these seedes are very effectuall to preserve the heart and vitall spirits, from the poyfon of the Scorpion or other venemous creatures, as also against the infection of the plague, or poxes, or any other contagious difeafe, they kill the wormes in the stomacke, provoke womens courses, cause an aborsement, and hath a digesting quality and a drying, fit to dry up and consume moist humours, both inwardly in the body, and outwardly in any moift or running ulcers and fores, and take away the paines that come after the biting of any venemous creature: the whole fruite or the branches of the trees laid in preffes, Chefts, or Wardrobes, keepeth

CHAP. LXXVI.

Limonia Malus. The Lemmon tree.

F Lemmons also there are divers forts, some greater, some smaller, some with thicker, and more rugged rindes, others with smoother, some with a very sharpe and tart juyce, others with a

1. Malus Limonia acida vulgarie. The ordinary Lemmon tree.

The Lemmon tree groweth usually great and high with great armes and slender branches armed with long greenish thornes, the leaves are long and very like unto Bay tree leaves, but den-

ed about the edges, or like unto the Citron leaves batleffer, and full of holes like unto them also; the flowers grow after the same manner as the former, but are wholly white and as sweete: the fruite hat followeth is somewhat long and round, with spaler yellow rinde then in any of those before, omewhat rugged or uneven, and not fo fmooth as in other forts, and fomewhat thicker alfo, the juyce whereof within is almost as sharpe as the next, but tt may be difeerned to have the talte as it were but of an hedge fruite, and fuch like feede as the Cimnamong it, but smaller and somewhat longer, it be heedefully marked, though they may seeme

2. Malus Limonia acida cortice tenui.

The thin rinded fower Lemmon. There is no difference in the tree of this, from beformer, nor in the fruite, but that it is a little higger, the rinde of a fine pale yellow colour, moother then the other, and much thinner also, wholly replenished with a most delicate sharpe juyce, and the like feedes among it.

3. Malus Limonia acida fructu rotundo. Round Lemmons.

The tree that beareth these Lemmons, is in all things like the last, but that it hath few or no thornes at all upon it, and the fruite having a thinne ninde like it, is formewhat rounder then it, with imali crowne at the head, the juyce within being ulower altogether.

4. Malus Limonia dulcie major.

The greater fweete Lemmon. This Lemmon hath this difference from the other, hat it is greater then any of the former Lemmons, the rinde vellower and importh, and the juyce withmit much more sweete and pleasant, that it may be

cien as an Orrenge.
5. Malus Limonia dulcis minor. The Civill Lemmon

This Lemmon is to like the best fort of thin rinded fower Lemmons, that it is hard by the outside to know their difference, for it is of the fame fize, but of a little deeper coloured rinde, and the juyce within like the laft, of a pleasant tart taste, that may familiarly be eaten, or rather having but little sharpe taste in it.

This fort of Lemmon groweth wild in Syria and Egipt. Bellouise maketh mention of it also, that it groweth bout Cairo, that as he saith, are no bigger then Doves or Pigeons egges.

The Place and Time. We have had all thefe forts of Lemmons brought us from Spains and the Islands at severall times, whereby we have described them unto yoursand for their time it holdeth equals with the former, and the other that follow, that ishold their leaves ever greene and beare bloffomes, greene and ripe fruite all the yeare through. The Names,

Neither the tree nor his fruite as it is likely, were knowne to the ancient Greekes or Latines, but it is in thefe tyes as in former times called Malm Limonia, and the fruite Limones. The Spaniards as Clufius sheweth, call the tree Limera, and the fruite Limas, all other nations follow the Latine, according to their dialect. The Vertnes.

Both the rinds and the juyce of Lemmons doe come somewhat neere unto the property of the Citron, though ha weaker degree, and in the want of the one, the other may fafely be used to all the purposes before mentioned for the juyce, but the barke or rinde being thinne is seldome preserved or dryed to be used inwardly, but yet combeth lome what neere it, if any will apply it although weaker to felilt poylon, venome or infection, yet the juyce

Limonia Malus. The Lemmon tree.

out it.

TREBE 16.

being sharper, cooleth more, but doth not equally resist putride humours like it: an ounce and a halfe of the juyce of unripe Lemmons drunke with a little Malmery helpeth to clense and expell the stone out of the kidneyes and likewise killeth and driveth forth the wormes in the body of men or children: if an angell of gold, or so much weight of pure lease gold be set to steepe in three or source ounces of pure juyce of Lemmons for source and twenty houres, and then taken out, or the juyce drained cleane from it, and some of it given in a cup of Wine, with a little ponther of Angelisa roote unto any infected with the Plague, and dangerously sicke, (if there be any hope or likelihood of recovery) it will helpe them, the seedes of these are likewise almost as effectuall as of the Carrons, the juyce of the sweete Lemmons is neither so cooling nor so operative for any of the purpose afore mentioned. The destilled water in glasse from the inner pulpe or substance of Lemmons cleareth the skin from all freckles, spots or other markes in the sace, or in any other part of the body, provoketh urine, and breaketh and expelicththe stone being drunke, and helpeth also the unning scab, and killeth lice in the head, the wormes, in the hands or nose, and pushes and wheales in the skinne. The juyce of Lemmons is singular good to use at Sea in long voyages, to put into their Beverage to keepe them from the Scurvy, whereto long Sea journies are much subject; as also the more abundantly to quench their thirst in those hot climates; it is no lesse affull at home for Dyers, who spend much of it in striking sundry dainty colours which will never be well done with-

CHAP. LXXVII.

Malus Arantia. The Orenge tree.

Have likewise five forts or rather kindes of Orrenges to shew you, which are these.

1. Malia Arantia vulgaria. The ordinary Orrenge tree.

The grafted or ordinary manured Orrenge tree groweth often to a very great beighth and bigne fig. for eading large armes and branches with a rougher barke below, and finnoth greene on the

no ffe, spreading large armes and branches with a rougher barke below, and smooth greene on the branches, yet it is also often found lesse in lesse fruitefull soiles, sparingly armed with sharpe but short thornes, the leaves are somewhat like unto those of the Lemmon, but that each lease bath a peece of a lease set under it, and are not dented at all about the edges, and are as full of small holes in them, as any

of the former, the flowers are whitish, but of a stronger sweete seat then any of the rest, and used to many other purposes then either of the other: the fruite hereof is round, with a thicke bitter rinde, of a deepe yellowish red colour, which from it taketh the name of an Orrenge colour, having a soft white loose substance, next unto the outer coloured rinde, and a flower juyce lying mixed among small skinnes in severall parts, as in the other forts, with such like seed also: the juyce of some is less sower.

with fuch like feed also: the juyce of some is lesse sower then others, and of a taste betweene sower and sweet neere unto Wine.

2. Malus Arantia sylvestris.
The wilde or Crabbe Orrenge tree.

The Crabbe Orrenge tree (as our Crabbe Apple tree) groweth wild, and is fuller of branches, and thicker fet with thornes, the flowers and leaves are alike, but leffer, and the fruite is very small, and of a pale yellow colour, with a thicke rinde and little juyce or sharpe within it, but plainely tasting as a Crabbe with us, different from a good fruite.

3. Malus Arantia cortice dulci eduli, The Apple Orrenge.

This Orrenge differeth from others not so much in the colour of the outer barke which is of a deepe gold yellowish red, but in the whole fruite, which is throughout as firmealmost as an Apricocke, and yet distinguished into parts on the inside, like others, which together with the barke or tinde is to bee eaten like an Apple, the barke or rinde not being bitter or tough like the rest: the Spaniards call this Warana caxel.

4. Malus Arantia unico grano. The Orrenge without feedes.

This onely different from that Orrenge with the best fower juyce in having but one graine or feed in the whole juycelying within it.

5. Malus Arantia pumilio. The Dwarfe Orrenge tree.

The stocke of this dwarfe tree according to his name is low, and the branches grow thicke, well stored with leaves, but they are lesser and narrower then the other, the slowers also are many, and thicke set on the branches, which beare fruite more plentifully then the former, but is lesse then the greater forts, yet as well coloured.

The Place and Time.

All these forts likewise we have seene being brought us from Spaine, and Portingall, the hedge or wilds Crabbe

Malm Arantia oulgaris. The ordinary Orrenge tree.

we from the hither parts of Spaine, and keepe time with the reft.

it shought that these Apples were knowne to the auncients who called them Mala aurea Hesperidum, being stany where else and therefore Hercular made it one of his taskes or labours to flay the Dagon that kept the saden where they were, and brought them away with him? Some call them Aurantia a corticis colora aurea, at loose of a mile as heavise spide at the form way with him? Dodonem Aurantia a corticis colora aurea, which mans thock test since with them to Golden Apples they are indeed: All nations call them according to the Latine and Classica since with the Spaniard, call them Normania, and the third fort here fet downe National the Carenge Powerant, and the France Powers of Orenges. The flowers of the Oringe tree are called Napha, and the opportunest condoct shem Unguentimes: Mapha.

The Herenes.

The rinde of the Orzenges are bittetter and hoster these choic of Lemmons, or Citrons, and therefore doe warme for the more, beliping to breake the winde thin ein, and the flegme, and after the bitterneffe is taken for them by fleeping them in water for fundry dayes, and then preferved either wet or dry, befides their use is the preferved either wet or dry, befides their use is clirons have: the juyce is farreinferiour to either of them, and are fitter for meate then medicine, yet as five ounces of the juyce taken at a time, will drive forth pairid humours from the inner parts by fweat; after freengthen and comfort the lisert. The destilled water of the flowers, befides the odoriferous sent it is higher the prefume, it is good against contagious disesses, and pellitential feavers, to drinke thereof at surjoines, it helpseth also the cold and mostly instruction of the mother: the oynement that is made of the flowers at omitted to annoint the floriacke to helps the cough, and to expectorate the cold raw flegue, and to warme at confort the other places of the bodyes.

CHAP. LXXVIII.

Malum Affyria vel Poma Adami, Adams Apple.

Histore for the most part groweth as great as the Orrenge tree, yet sometimes it is no higher then the Citron tree, and spreadeth faire great armes and branches with few, and those short thornes upon them, the leaves are faire and large, almost as great as those of the Citron or Lemmon tree, pounced with holes in the like manner, the flowers also are not much unlike, but the fruite that followeth is more like un-

an Orrenge, yet two or three times bigger, pale allow the times bigger, pale bigger, pale bigger, pale times are times as if it had beene bitten, from whence was obtruded that fond opinion unto a vulgar, for wife men would be ashamed of for rigulous an opinion, that it was the fruite that Adam aled in Paradice, and that therfore the markes should make upon the whole kinde ever after but thus have upon three or fourt trees foiled into mens conceits by religious cozeners, for Adams Apple, like to the allockes in the World) a Spongy substance extroir, and with an acide sweete juyce, yet nor so heafast as others, lying in parts and round seeds among it like the Citron, which may be eaten altoger in like the Apple Orreage as Clussims saith.

The Place and Time.

This groweth with the other fores in fundry places strain, among the Monatteries, or with others that strainous of rare fruites, and is in nature like the reft, oregreen, and bearing flowers and fruite all the years

The Names.

This is called by fome Pomam, and Malam Affria, as denoting forth the place of his originall, the sore generall part Fome Adami, yet Cordus in historia, alleth it Citrius altera, the Spaniards as Clusius faith, allit Toronias, and some Zambons, as the Portingals touthe Indians Lomic, and Pomi di Adams, the French Incires in generall.

The properties bereof are referred to the Lemmons of hiving a milder juyce, and therefore not so much regarded as the others: it is by some used to kill the thand take away the scale, to cut one of these through the middle, and thereon to call some sine pouter of Brimstone, being beared under the cinders, and these on the parts affected afterwards.

Malam Affria vet Pome Adami. Adams Apple.

CHAP. LXXIX.

Males Panica. The Pomegarnet tree.

He Pomegarnet tree is diffinguished into the manured, bearing fruite, and into the wildebearing none, each of these have likewile diversities in them : Of the manured fruite, there is both sower and fweete, and of a winy talte betweene fower and fweete, for for they are diftinguished in the Countryes where they grow : the wilde kinde likewife is of two forts, and both bearing double flowers, but one greater then another, but no fruite ever followeth them:

1. Malm Punica fativa. The Pomegarnet tree bearing fruite.

This Pomegarnet tree groweth not great in the warme Countries, and where it is naturall (and with us rifing for the most part into sundry brownish twigges) not above seven or eight foote high; spreading into many sender branches, here and there set with thomes, and with many very laire greene shining leaves like in forme and bignesse unto the leaves of large Myrtle leaves, every one upon a small reddish footestalke: among the leaves come forth here and there, the flowers which are tike bell flowers, broad at the brimmes and imalier at the bottome, being one whole leafe, divided at the toppe into five parts; of an orient red crimos colour naturally, but much paler with us, and many veines running through it, with divers threes in the middle; and flanding in a brownish hollow cup, or long hard huske: the fruite is great and round with a hard smooth browmish red rinde, not very thicke, but yellowish on the inside; and a crowne at the toppe: Rored plentifully with a most cleare liquor or juyce like wine, either sweete or sower, or betweene both, fall of seedes, included in skins. and the liquour among them: fometimes this breaketh the rinde as it groweth which will cause it to for suickely. Cordus in historia maketh mention of one that hath no kernell or feed within it, and doth also mention a wild kinde to grow in Spaine, and Africa, which I cannot believe to be any other than that wild kinde with double flowers, which followeth next to this to be described, for he maketh that which beareth fruite to have a double flower which is not fo.

2. Malus Punica sylvestria major sive Balanstium majus. The greater double blossomed Pomegarnet tree. The great wilde Pomegarnet tre: with us, growt th altogether into flender brownish branches, with some thornes among them, and thining greene leaves former har larger then the former, but into a thrubby low tree naturally, from the branches shoote forth flowers very double, as large as a double Province Rose, but with shorter small leaves, of an excellent bright crimson colour, tending to a filken Camation. Standing in brownish hard cups or huskes, divided into five parts: there followeth no fruite unto thele-

3. Baleftium minus. The leffer double Pomegaract tree.

This smaller kinde differeth from the other but little, the leaves onely are of a ladder, greene colon; the flowers smaller, and lesse thicke, and double, and of a sadderred Organge tawnie colour, set also in such sike hard cups

The Place and Time.

The manured kindes grow in Spaine, Portugal, Italy, and in other warme Countries, but with us preferred rise. al housed with great case and the wild kinde with much more : They lower very hardly with us, the first not untill May, and the other much 2. Malus Punica Sylvefte is five Balanfium majns. The great double blottomed

The Names.

The Pomegarnet is called in Greeke esa' and esa', and by Hippocrates ila, in Latine Malin Panica, and Malin Granata, and the fruite Mamematum, or Punicum, because it is thought that they were brought set from that part of Africke, where old Carthaga flood, into that part d Spaine, which is now called Granado, and from thence called Grana-: The flowers of the tame kinde as Diofcorides faith are called Cysiwet Play maketh the flowers of the wilde kinde to be called Cysinus. a the flowers both of tame and wilde to he Balanftsum, but properly altake it, Cytime is the cup, wherein the flower, as well of the tame as side kinde doth Rand, for unto their likenesse, both the flowers and feed refels of Afarum, and the feede veffels of Hyofcyamus are refembled, and scusto the whole flower, and Balanfium is generally with us taken to keenly the double flowers of the wilde kind : the rinde of the fruite is aled in Greeke Aldor and older, and so also Pseism and Sidium in Latine alled in Greeke Aldor and older granatorum: The greater double in generally Malicorium or Correct granatorum: The greater double instance in called Balanstium Greicum and Cyprium, because it goweth in both places, and the last is called Romanum. The Arabians all it Kaman and Raman, the Italians Melo granata, and Pomogranato, he Spaniards Granadas and Romanas, the French Grenadier the tree, and land de Gronade, and Migraine the fruite, the Germanes Granatoepffel, the Duck Grannetappel, and we in English Pomegranet or Pomegarnet. The Vertnes.

All the forts of Pomegarnets breed good clood, but nourish little, and sthelping to the stomacke, yet those that are sweete please best, but but they somewhat heate it and breede winde, and therefore forbidden hagues, because they breede choller : the sower doe binde, and are fir franhot fainting stomacke, and stay casting, and provoke urine, and resomewhat offensive to the teeth and gummes, in the eating: those that are of a meane or winy taste, are indifferent to each part: the

fedes within the fruite, or the rinde thereof doe binde very forcibly, eithe the pouther or the decoction taken, and flay cafting, the bloody flixe, women's courses either red or white, the fitting of blood, and the running of the reynes; it is taid also that they are good for the dropsie: the flowers workethe same effects: the fruite is good against the bitings of the Sea Hare, and the bitings of the Scorpion, and flayeth the immoderate longings of women with childe, the decoction of the rinde, or feedes of the fruite, with a little Syrope put to it, is good against Cankers in the mouth, and ulters in the privy parts, the fundament, wany other part of the body, and is good against the rupture, it helpeth also the ulcers or running fores in the ures or nose, or rheumes in the eyes, to be dropped or injected, and fastneth loose teeth, destroyeth the flat wormes in the body, and helpeth to take away wens, or the like out-growings in the flesh : with the rinde of Pomegarnets instead of Gaules, or else with the Gaules also, is made the best fort of writing incke, exceeding the adinary, both for blackenesse and durability.

Pomegarnet tree.

CHAP. LXXX.

Pennui. The !lume tree!

F Plummes there is so great variety, as I have shewed elsewhere, that it were but actum agere to repeate them here againe. I will therefore give you a generall description of the tree (I meane the manured kinde, for the wilde kinde which is our Blacke thorne or Sloe, is extant in another Classis of this Worke before) and that the fruite differeth in formo, colour and tafte, one from another with the belt properties they are serviceable unto. Vnto the Family of the Plummes belong both Apricockes, Peaches, ud Nectarins, all of them being Plummes, but of severall kindes. I will therefore place the Apricocke in this Chapter as nearest to them, and the rest in the next Chapter following.

1. Pruntu valgaria. The ordinary Plumme tree.

The Plum tree for the most part riseth to be a great tall tree, whose body and armes are covered with a rug-gedbarke, more or lesse, the younger branches being smooth in all: the leaves are somewhat long and broad, and tounder in most then those of Cherryes; yet differing much among themselves, some being longer, larger or tounder then others: the flowers are white and small, made of sive leaves a peece: the fruite is very variable in forme, some being avail, or Peare fashlon, or Almond like, or round, in colour some being white or yellow, religreene, or blacke : and in tafte, some being soft and waterish, others firmer and not so moilt, some sweete, loge lower, and others of a meane taite betweene both, or harsh, or of a taste differing from all these, wherein is consined a small smooth flattish stone, with a white bitter kernell within it. Mr. Tradescant had a fort that bore Fire dedesbleflowers, but perifhed, not long continuing with him.

2. Malm

Macleo

Pruna. The Plumme tree.

Armeniasa malus five Pracecia. The Apricooke tree.

2. Malus Armeniaca sive precocia. The Apricocke tree.

The Aprico:ke tree, if it fland by it felfe as a flandard tree, like other Planme trees (which it feldome doth in our Country, for that it would hardly beare fruite in that manner) will rife to be as great as a Plummetre, with great broad, and almost round seaves, but pointed at the ends and finely dented about the edges : the flowers are white and like the former but larger, the fruite that followeth is round, with a cleft or open furrow in the middle, somewhat like unto a Peach, of a pa'e yellowish colour on the outside, as well as on the inside, and a little reddifh on a fide in molt, yet whiter in some, and of differing fizes also, some smaller or greater; of a firmer or falter close substance then any of the Plummes; a smooth flattish stone in the middle, great or little, according to the fruite, which is ripe with or before the earlier fort of Plummes (and likely long before any of our earely forts were knowne in former times) which was the cause of the name, and a sweete kernell within it, yet it is faid there is one that hath a bitter kernell, which I have not feene. The Place and Time

All the forts of them are planted, none of them growing naturally in our Country, and either in Orchards, for their private possessions, or in the Hedges, or other places of the Fields, Woods, or Parkes abroad, and flow-

er before eyther Apple or Peare, and the Apricocke before any Plumme, by a moneth or more, and is ripe by St. Iames tideufually, the other forts of Plummes comming on every one in their degree, some earlier, and some

The Names.

The Plume as it is thought is in Greeke the xoxxuumabz, of Theophraftun, lib. 4.c. 3. and the fruite xoxxuumaa, in Latine Prantu and Prantm, but I much doubt of it, because beside other things, not correspondent, he saith the leaves doe alwayes abide on the tree. Ingen: Pranorum tarka faith Pliny, even in his time, but I thinke more then twice fo many now. Bellonius lib.2.0,91 . faith, that the Damafee Plummes, that he faw dryed at Damafee, were bigger then a Wallnut, of a firme substance, and sweete talte, a little tart, with a stone within it, rather long and flat, then thicke and round, and were deare fold even there. The Apricocke is called under aguntary, we survives and became, and recocke is called under aguntary, we survives, and became, and Precocia by all Authours, yet some call it Baracocca: The Plumme is called by the Arabians Anas, Avas, and Hagias, by the Italians Prune, and Succine, by the Spaniards Prunas, Andrinas and America, by the Preneh Pruner, and Prunes, by the Germanes Pflaumenboom, by the Dutch Pruymbonen, and we Pluames. The Apricocke is called by the Arabians Mex, and Mirmex by the Italians Armoniache, Moniache, Bachoce and Grifomele, by the Spaniards Albiricoques, Alvaricoques, and Albarchigas, by the French Abricos, and Carmaignoles, by the Germanes Sir Isban Pfferfich, and by us Apricocke.

The Verrues.

There is much diversity in the faculty of Plummer, for some that are sweets, doe mostlen the stomacke, and

TRIBE 16.

make the belly foluble, those that are sowre doe quench thirst more, and binde the belly, yet they are all in some for cooling: the moifter fort and more waterish, doe foonest corrupt in the stomacke, but the firmer doe nouif more, and offend leffe taken plentifully, and those are the fittest to be preserved and kept all the yeare : but the dryed fruite, which are fold at the Grocers, under the name of Damaske Prunes, doe fomewhat loofen the bely, and being stewed are often used with the pooter fort of people, both in health and sickenesse to rellish the mouth and ftomacke, to procure an appetite, and a little to open the body, allay choller, and coole the ftomacke: is purging decoction with Sens Rubarbe, &c. be made for them to be flewed withall, it maketh them the more jurging, and the more readily to be taken by those that have weake stomackes; the leaves of the tree boyled in wine, is good to wash and gargle the mouth and throate, to dry the fluxe of theume to the palate gummes, or almonds of the throate: the gumme that commeth out of the trees, is good to breake the flone, and doth ferve as aglew to faften any thing withall: the faid gum or the leaves boyled in vinegar and applyed, killeth tetters, and ringwormes, The Apricocks have no use in Physicke that I know, but are wholly spent as a junker, eyther fresh andgreene, or dryed preferved or candid, to fort with others, for the fame purpofe. Onely Matibiolis giveth atheuse of the oyle, prest out of the kernels of the slones, as the oyle of Almonds is made, to be good against he inflamed piles or hemorrhodes, the tumours or swellings of ulcers, the hoarsenesse of the voyce, the rough-sesse of the tongue and throate, and likewise the paines in the eares sive ounces saith he, of the said oyle taken with one ounce of Mulcadine, driveth forth the stone, and helpeth the chollicke.

CHAP. LXXXI.

Malus Perfica. The Peach tree.

5) He variety of Peaches is great, whereof the Nectarin is a kinde, which because I have already de clared them in my former Booke, I will onely here give you the descriptions of them in generall, and the speciall uses, as I said in the last Chapter: but hereunto I must adjoyne another strange tree of the West Indies, which Clasin tooke to be the Perfea of Theophrastin, Dioscorides, Galen, Pliny, and others, which how it doth agree, you shall understand.

1. Malus Perfica vulgaris. The ordinary Peach tree.

The Peach tree groweth not so great as the Apricocke, planted either by it selfe, or against a wall, but yet spreadeh branches reasonable well, from whence fpring smaller reddish twigges, whereon are set long and narrow greene leaves, dented about the edges: the blossomes are greater then of any Plumme, and of a light purple coour, after which followeth the fruite, round, and fometimes as great as a reasonable Pippin, especially some; for home are much fimaller then others, as also differing in colours and tastes, as russet, red or yellow, waterish, or fime, with a frize or cotton, all over, with a cleft therein like the Apricocke, and a rugged, furrowed great Itone

Malus Perfica. The Peach tree.

Perfea arbor. The Laurell Peach.

mond

within it, and a bitter kernell within the stone. It sooner waxeth old and decayeth then the Apricocke hu

There is another kinde of Peach, whereof Camerarius and Bauhinus in his Matthiolus, and Gesner in hortis make to perfice a month of the All mention, whole kernels within the rugged ftone is not bitter as others are, but sweete like an Almond.

The All. The Nectoria 2. Nuci persica. The Nectarin.

The Nectarin feldome groweth fo great as the Peach, the body and elder boughes being somewhat whitish. and the younger branches very red, whereon grow long leaves, very like those of the Peach: the biossome likewife is reddiffe, but but hith imaller and narrower leaves, and the fruite that followeth is as round and great as a fmall Peach, but smooth on the outside, and not rough or cottony as the Peach, nor having any cleft, of differing colours and taftes, some greenc, others whitish or yellow, and some red more then others, all of them of a fait firme substance, and more delicate then the Peach, but with such a rugged stone as the Peach and a bitter kernell

7. This frangetree whereof Clusso onely first made mention, is a reasonable great tree, spreading pale greene branches, and faire fliffe greene leaves on them like unto the large Bay leaves, grayish underneath and some crosse veines running through them, Iweete both in fent and tafte, but a little stipticke and biting: the flowers are like those of the Bay tree, and grow many and thicke settogether in tusts, at the ends of the branches confishing of fix pale coloured leaves a prece, after which come fruite, at the first greene and like a plumme, but growing ripe is long and formed like a peare, of a blacke colour and pleasant taste, having a long and round kernell within it. of the fashion of an heart, and of the talle of a Chesnut or Almond: this abideth alwayes greene, not loofing the leaves in Winter.

The Place and Time.

The two first are familiarly noursed up in our Orchards and gardens through the Land, but from whence is their originall I cannot shew you: The last Clusius faith was brought forth of the West Indies, and planted in a monastery in Spaine, where he saith he onely saw one tree, and none any where else, yet he understood from Doctor Tonar at Sivill, that he had such another growing with him: They all flower in the Spring and fructifie in Au-The Names.

The Peach is called in Greeke Theorem united and p. dianna also by some, in Latine Malus Persica, and Rhodacina. but not d'edua, as some would have it, tobe derived from Duracina, for Doracia is distinguished by Paulan Leineta, from Pracocia, and Armenia, and by him made all three to be better then Peaches: neither is the Greeke Doracia, derived from the Latines Duracina, but rather e contra. The Nectarin is called by Matthiolis and Co-(aipinua, Nucipersica, because it resembleth the Wallnut in the round smooth outer rinde, and the Peach in the meate, fibiliance and frone. Anguilara calleth it Perficanux, by the fame intention, and Pliny Nuci prunum. The last Clusius maketh the question, whether it be not the Perfea of Theophrastu lib.4.c.2. or no, which Dioleorides, Galen, Pliny, and others, doe make mention of also, and which Theophrass w describeth to be a great and a faire tree, and most like unto the Peare tree, both in leaves flowers and branches, but that this hath an everlasting leafe; it beareth much fruite, and is ripe at all times, the young still follow the old; the fruite is of the bignesse of a Peare, long and like an Almond, and of a greene colour, it hath a stone within it, like a Plumme, but much leffe, and of a fofter fubflance, very sweete, thus farre Theophraftus. Now let me descant a little hereon, and compare them. First, the leaves of Perfea, faith Theophrastin, are most like unto the lease of the Peare tree. and this faith Cluffer, is like unto the greatest Bay leafe, the one is almost as broad as long, and the other twice as long as broad, befides it is small pointed, the flowers of Perfea are like the Pearetree, which are much larger then those of the Bay, and doe not grow to many together as this doth, nor at the ends of the branches like this: the fruite of Classus is blace, of this greene, of that like a Peare, of this as bigge as a peare, but like an Almond. of this the stone is like a Plumme, of that like an Heart, which is round and not flar, as that plumme stone is, that hath ripe fruite onely in Autumne, this at all times of the yeare. And besides all these, which are differences sufficient to distinguish them. I doe not finde almost any plant, either herbe or tree growing in the West Indies to be like unto those that grow in Europe, the lesser /fia, or the hither part of Africa, and therefore by all probabilities, this of Clufius cannot be that of Theophrastus, yet this sheweth an excellent judgement in Clusius to referre this tree to that Perfea, but in any judgement this Perfea of Theophrastus is most likely to be some kinde of Myrobolane, or elfe fome other fruite not knowne tous, It was called faith Clufius by them where he faw it, Mamay, but he was afterwards enformed by Dector Tonar, that it was not Mamay, but called Aquacate, by the Indians. Some have thought this Perjea, to be all one with the Perfica arbor, as Palladius calleth it, or Ma-Im Perfica of Diofcovides. Gaza translating Theophrafin in tome places, rendereth it Perfica, and in others Perfea, as Pliny in one place also confoundeth them both together, although in another he distinctly speaketh of Perfea, and separateth it himse'fe from Perfica: but how much they differ one from another, the descriptions of both doth plainely declare to any : The Peach is called by the Arabians Sauch and Chanch, by the Italians Persiche, by the Spaniards Pexegos, by the French Pefches, by the Germans Pferfichbaum, by the Dutch Perfehoom, and by us

The Vertues

Some are of opinion that the leaves of Peaches are of a cold quality, but Galen sheweth that the buds and leaves have an excellent bitter quality, that if they be bruited and laid on the belly, they will kill the wormes, and fo will they doe also, if they be boyled in Ale and drunke, and open the belly likewise, and also is a fafe medicine to discusse humours, being dryed; and the pouther of them strewed upon fresh bleeding wounds, doth both flay their bleeding and close them up: the flowers being fleeped all night in a little Wine, flanding warme, ftrained forth in the morning, and drunke falling, doth gently open the belly, and move it downewards, and a Syrupe made of them by reiterate infusions, as the Syrupe of Roses is made is found to worke more forceably then that of Roses, for that it provoketh vomitting, and spendeth waterish and Hydropicke humours, by the continuance thereof: the flowers condited or made into a conserve, worketh to the same effect, the gumme or rather the liquour that droppeth from the tree being wounded is given in the decoction of Coltsfoote, unto those that are

TR 1BE 16. mobiled with the cough or with shortnesse of breath by adding thereto some sweete wine, and putting some Suffron also therein, it is good for those that are hoarse, or have lost their voyce, helpeth all the defects of the lungs and those that vomit or spit blood. Two drammes thereof given in the juyce of Lemmons, or of Radish, is good for those that are troubled with the stone it is said some given in Plantaine or Purssane water, stayeth the cashing of pitting of blood: the kernels of the stones doe wonderfully case the paines and wringings of the belly, brough winde or sharpe humours, and are much commended to be effectuall, to breake and drive forth the fine, which that they may the more powerfully worke, I commend this water unto you to drinke upon occasion. tree or four ounces at a time. Take fifty kernels of Peach stones, and an hundred of the kernels of Cherry fones, a handfull of Elder flowers, fresh or dryed, and three pints of Muscadine. set them in a closed pot, into a bed of Horse dung forten dayes, which afterwards filled in glaffe, with a gentle fire, keepe for your use: The milke or creame of these kernells being drawne forth, with some Verven water being applyed to the forehead and temples, doth much helpe to procure rest and sleepe to sicke persons wanting it; the oyle likewise drawne from the kernels doth the same being annointed, the said oyle put into glisters doth ease the paines of the choliske proceeding from winde, and annoynted on the lower part of the belly doth the like, and dropped into the prescaseth the paines of them, the juyce of the leaves doth the like, killeth the wormes and ulcers in them, being also announced on the forehead and temples; it helpsth the Megrome and other paines in the head: If the kernels be bruiled and boyled in vinegar untill they become thicke, and applyed to the head, or other places that have shed the haire, and are bald it doth marvellously procure the haireto grow againe. The Peaches themselves being eaten, by reason of their sweetenesse and moisture, doe soone putresse in the stomacke; and therefore Ga-In adviceth that they be never taken after but before meate alwaies, so shall they make the rest to passe away the more speedily with them: or else taken after, they corrupt the rest in the stomacke with themselves. The Nectarin hath a firmer substance, and a more delectable taste, for which it is most accepted, being of nouse in phylicke that I know. The Perfea is not used with any.

CHAP. LXXXII.

Amroalus. The Allmond tree.

L He Almond is fo like unto the Peach in every part thereof, and yet differing from it, that I can doe no lesse then joyne it next, in a severall Chapter, and although there are sundry sorts of sweete Almonds, some great and some small, others long and some short; and a bitter kinde also, yet being in the whole surface, to like one unto another, that they can be distinguished by no other thing then the Allmond, I will onely give you one description, and shew you their differences herein, which I thinke shall be suffici-

The Allmond tree groweth greater and higher then any Peach (and is therefore usually planted by it felfe, and not against a wall, and never grafted that I have seeme and knowne, that would take and abide, but is alwayes planted of a stone put into the ground, where you would have it to grow, for it hardly sufferethatransplanting) the body thereof becomming very great, whereby it sheweth to be of long continuance, spreading greater armes and smaller branches, but brittle, with long narrow leaves on them, very like unto the Peach tree: the flowers are of a paler purple colour then the Peach bloffomes, and not io bitter, and the fruite very like the Peach, for the outward forme, before it be ripe, but the outer rinde is a dry skinne without any cleft in it, or edible substance under it, as the Peach hath, and the shell under it is smooth and not rugged like it, and not so thicke a kernell within, being bitter in one kinde, which are small like the Barbery Allmonds, and sweete in all the rest, whereof some are small, and called Barbery Allmonds, others long and slender, and are called Iord. " Allmonds, and others fort and broad. called Valentia Allmonds: it is observed that those that grow in the Isle of Cyprus, bend downe their heads, contrary to all in any other place.

The Place and Time. They grow in all places planted that I know or can heare of in Syria. Barbery, Turkie, Spaine, Italy, and wherefoever, we have both the bitter and the fweete of that fort, that is, thicke and short, growing in many places of our Land, and blossome earlier then the Peach of any fort, and the fruite ripe also before them.

The Names. It is called in Greeke apur dan, and the fruite apur-Jan and apuy Janor, in Latine Amygdalau, and the fruite Amygdalum, and Amygdalium, fome thinke that Caro

Chamacera/m Alpina repens.

The creeping dwarfe Cherry tree of the Alper.

meant these by the name of Nuces Greca, but yet some doe rather referre them to the Wallnuts. Columella mameant their by the name of traces graces, and Amygdala, as of three kindes, for many thinke the Almond was not known in Italy in Cato his time. Pliny out of Theophraffus settleth downe the way to make the bitter All. mond tree to beare sweete Allmonds, and the sweete bitter : but with such fond conceits of alterations and transmond tree to beare tweete Annious, and the tweeter the mutations are the workes of the ancients according to their Gentilisme too plentifully stored, which we know is contrary to the law, that God hath fet in it felfe to preferve the kinde, and although there be not onely lufar, but luxus nature, as it hapeneth in many things, as in the Hermaphrodite, yet that altereth not the law of nature, and notwithstanding the example of the Mule. The Arabians call the fruite Ianz Kanz and Lanzi, the Italians Mandole, the Spaniards Almendres, the French Amandes, the Germanes Mandolkern, the Dutch Amandel, and we in English Allmonds.

The Vertues. The sweete Allmonds are the pleasanter meate, formed into many fashions as every one liketh, but the bitter are the more physicall; the sweete are hot and most in the first degree, the bitter are drying in the second: The fiveete Allmonds blanched and dryed, that they may be made into pouther, and so taken by it selfe, or with other things helpeth to binde the loosenede of the belly: the oyle of sweete Allmonds, mixed with the sine pouther of Sugar Candy is good for the dry cough, and for hoar feneffe, to take a little at once; the faid oyle drunke either alone or with fome Syrupe of Mersh Mallowes, is good for those that are troubled with the stone, to case the paines, by opening and making slippery the passages thereof: It is used also by women in Childbed after their fore travell: being mixed with oyle of Tartar, it maketh a creame called Lac Virginis, that clensethe skin, and lenyseth the drynesse or roughnesse, parched with the winde or otherwise: it is used also by it selfe or with other things, to annoint the flomacke for the cold: The pouther of the Allmond cakes, after the oyle is preffed from them. doth ferve farre better then lope to clenie the hands or skinne in any place, and to supple the parts and make them fmooth: The greene fruite while they are very greene, are eaten to helpe the moilt humours in the stomacke, and are eaten with pleasure by women with childe, and being preserved, are very delicate. The bitter Allmonds doe provoke urine, and womens courses, and helpe to mollisse the belly; they are good also taken with Amylum and Mintes, for the spirting of blood, and taken with water they are good for paines in the backe. and the inflammation in the lungs; or elfetaken with fine Turpintine, made into an electuary or licking medicine, with honey and milke, they are good for the obstructions of the liver, for the cough and the winde chollicke taking the quantity of a Hafell nut at a time : the oyle of bitter Almonds is effectuall to all the purpofes afor efaid and doth more effectually clenfe the skin then that of fweete Almonds: it is also used for the noyle and deafeneffe in the eares, to droppe thereof into them: the bitter Allmonds themselves beaten with oyle of Roses and Vinegar annointed on the temples, doe case the paines in the head, and procureth sleepe and rest in hot agues, or phrenies: it doth mollefie the (tiffenesse of the sinewes and joynts, and healeth the bitings of dogs and foule ofcers: if one doe eate five or fixe bitter Almonds before he fall into drinking company, it will keepe him from being overtaken more then the rest; and it is said that if they be given to a Foxe in his meate, it will kill him.

CHAP. LXXXIII.

Cerasus. The Cherry tree.

Here are as many forts of Cherries almost as of plummes, the most whereof I have declared in my former Booke, but there are some other sorts both tall and low, that are not there mentioned, and are to be shewed in this place. And although I have there set forth, both the descriptions and figures in part of some that I doe here againe mention, both of the taller and lower fort, yet I also give you the figures of some there not set forth but described: the double repetitions being to shew the diffe-

rences.

1516

CHAP.83.

1. Cerasu vulgaris. The ordinary Cherry tree.

The Cherry tree rifeth to a reasonable heighth and greatnesse, spreading well and somewhat thicke, the leaves are neere the plumme for forme, but tomewhat longer in molt, and dented about the edges: the flowers come forth two or three, or foure at the most at a place or joynt together, every one on his owne footestalke, consisting of five white leaves, with some threds in the middle, after which come round berryes, greene at the first, and red when they are through ripe, of a meane bignesse and pleasant taste, with a hard white small stone within it whose kernell is somewhat bitter, but not unpleasant. Some sorts are greater and pleasanter than others, some tart, some waterish, others firme, some red, others whiter.

2. Cerasus Trapezantina sive Laurocerasus. The Bay Cherry, or Cherry Bay. Because this tree beareth berryes very like to faire great blacke Cherryes, and a stone within them, like unto a Cherry stone; I thinke it is most worthy to be referred to this stocke or kindred of the Cherryes, howforver formerly I fet it among some kindes of Bayes. It sometimes groweth to be a faire great tree, spred into many branches, but usually with us it groweth as a shrubbe, shooting forth sundry greene branches, with goodly faire shining fresh greene leaves thereon, larger then any Bay lease, the slowers are many and whitish, growing on a long cluster like unto the Padus Theophrafti, here also expressed, made of five leaves a peece, but much greater then they, after which commeth the fruite, being as large as any Flanders, and of a very blacke thining colour very sweete, with a round stone within them, very like unto a Cherry stone, this is taken to be the Lotus secundus Theophrasti by Lugdunensis, which may very well be.

3. Cerasus racemosa putida Padus I beophrasti ditta. The strange long cluster Cherry. This tree as I said, is referred to the stocke or kindred of the Cherryes, although it doe not much resemble any of them. It groweth to be a great tree, whose body and greater branches are covered with a sad coloured barke, the younger branches being greene, whereon grow fomewhat broad and short leaves, harder and more crumpled then any Cherry leafe, and dented about the edges : the flowers come forth at the joynts with the leaves in a long cluster many together, like those of Labannum, the Beane Trefoile, but very small, and of a downy white t. Gerafus vulgaris. The ordinary Cherry tree.

Corafus avium racemsfa. The clufter birds Cherry tree?

Chamacerafus altera en Hungarica. Another dwarfe Clerry, and one of Hungary.

Cerafa Americana five de Baccaleas.
The Baccalaos, or new found Land Cherry.

2. Cera fus Trapequatina five Laurocerafus.
The Bay Cherry, or Cherry Bay.

3. Gerafus racemofa pusida Padas Theophrafti diffa. The firinge long cluster Cherry.

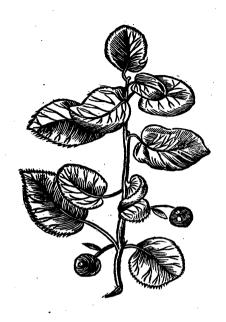

4,5. Machaleb Germanicum & Syriacas The wild rocke Cherry of Austria, and perfuming Cherry of Syria.

6. Chamacerofin montana Acaris folio. The mount aine dwarfe Cherry. 7. Cerafu exwice rotundifolia Indica. The firange or Indian Clerrie.

colour, smelling somewhat strong and sweete, after which come the fruite, which are small blacke round berryes so bigger then small pease, with little substance upon them, and very small stones within them, every one on a bort soctelalke, but many together in a long cluster, like the wilde cluster indes Cherry, of an harsh taste, and of an evill sent while it is eating. The wood also smellets strong or not well, from whence came the name.

A. Machalob Germanicum. The rocke wilde Cherry of Austria.

This rifeth fometimes to the heighth of a reafonable tree, on the branches whereof come forth certaine knots or knobs, and Cherry tree like leaves at them but leffer, and from among them a small long greene stake, with eight or ten white flowers thereon, hanging in a cluster, made of five leaves a peece, like unto the Cherry bloftome with a long pointell in the middle, compassed with five white chives, tipt with pendents, purplish at the
stift, and yellow after, as sweete as Hawthorne flowers, standing in greene huskes, divided into sive parts, after
which come small berryes no bigger then pepper cornes, and blacke on the outside: at the ends of the branches
grow such like shining greene leaves as the other dented about the edges.

3. Machaleb Spriacem. The persuming Cherry of Spria.

This Machaleb of the Arabians doth not grow to any bignesse, but with broad short leaves like the Line tree, pointed at the ends and dented about the edges, the flowers are white, and the berryes blacke, having a small stone within them like unto a Cherry stone, but lesser, and a brownish cored kernell within them, sinelling hot and sweete, yet bitter within them, sinelling hot and sweete, yet bitter within them, and persuants doe use to mixe with other persuants sweetes.

6. Chamecer of in montana Acerit folio. The mountaine dwarfe Cherry.

This dwarfe plant is reckoned afforto the Cherryes, having broad leaves cut in or divided at the edges, releanbling those of the Maple tree: the fruite is round and red like unto a Cherry, and therefore reckoned as one, two for the most part standing together on a long stalke.

7. Chamacerassu exotica rotundisolia Indica. The strange or Indian Cherry.

This Exoticke Indian, hath streight slender branches, with faire and somewhat broad leaves thereon, somewhat likeunto those of the Cherry tree, yet some rounder and not pointed at the ends, but all finely derited about the ed-

gest the fruite is finall and red like a dwarfe Cherry.

The Place and Time.

The first kinde is alwayes planted in Orchards, where among divers other, it taketh up a roome. The second in Turkie, or Trabizond, and planted first in Italy, at Genea, in the Prince Orias Garden, where Bellonius first, with tedious travell found it; and was fent from Confiantinople, to Matthiolus and others. The third in Cone gravelly grounds in Sapey. The fourth, fifth and last, are express in their titles, and the fixth in Lombardy: And for the most part flower, and beare their fruite about the time that others of their fort doe.

The Names.

The Cherry tree is called in Greeke meines, and the fruite meina, in Latine Corasus and Gerasa. Atheneus

Writeth

Theatrum Botanicum. CHAP. 84. writeth, and so doth Pling, that the Cherry was not knowne in Italy, before the warre with Mith idates King of Portus, and that Lucius Lucislim after he had overthrowne him, brought it from Cordinate in Postus, into Italy, and gave it the name Cerasum, from the place he had it. The second is called by the Turkes Trebicon Curmasi, that is, Dattylus Trapezuntica, but by Bellonius first, as I take it, Laurocerasus, and Cerasus Trans. zyntina Dalechampity tooke it to be Lotus Africana, but Clufius contesteth there against. The third is taken by Dalechampin to be the Padus of Theophraftus, which Clufius taketh, or miliaketh rather, to be the Ceralus avium, or racemofa unigo herbariorum, which is quite another tree, as I have thewed among the other forts of Chertyes, and Bankinu followeth him therein, making them both one. The Barganian about the River of Seine, doe call it Pudu, (from whence it is likely Dalechampinu tooke the name, to come neere to Padu) and take it for a kinde of wilde Cherry, as the clutter Cherry is, and in the long cluttering of the flowers and fruite together very like it, and because the wood smelle: h strong, the Saviyans call it Putier, as also Corifer blanc. together very like it, and became the word the first property like it, and the first old f out all knowledge whereof he wrote as it seemeth. It came to me out of Italy, by the name of Lawrer regia, but is most usually now called Laurocerasin, and in English as it is in the title. The tourth is most likely to be the Cerasin solvestrie of Tragm, and the Mahaleb, or Macaleb of Clusius, and the Petrocerasin, or Chamecerasis petras of Gesur, which Bankium toulely confoundeth with Masthiolus his Mahaleb, and the Chamecerasis

Syriaca of Gefner, Which is the true Mahaleb to be both one, when as this fifth onely is the true kinde, as the fweete smelling fruite doth plainely declare, besides the diversity of the tree, as is before declared. The firt came as a rarity from the Indias, whereof no more can as yet be faid. The last is onely remembed by Gester in boria. and by Lugdunenfis, who faith that Gefner fent a branch thereof to Dalechampins, by the name of Chamaceralus montu Generifi. The Arabians call the Cherry, Sarafie, the Italians Ciregie, the Spaniards Cerazas, and Guindas.

the French Cerifes, and Guines, the Germanes Kerfen, and Kirfeben, the Dutch Kriken, And we in English Cherry. The Vertues. Cherryes as they are of divers taftes, fo they are of divers qualities, the weete are more labricke, and passe through the stomacke and belly more speedily, but are of little nourishment, the tart or sowre are more pleafing to an hot fromacke, and procure an appetite to meate, and helpe to kut tough flegme, and groffe humours, but when these are dryed, they are more binding the belly then being fresh, and doe give a fine rell th to broths and drinkes wherein they are boyled; being cooling in hot discases, and welcome to the stomacke, and provoke urine; The Gum of the Cherry nec dissolved in Wine, is good for a cold cough, and hoarsenesse of the throate: helpeth to give one a better colourin the face. that peneth the eye-fight, ftirreth up an appetite, and helpeth to breake and expell the floue: the blacke Cherryes being bruifed with the stones and distilled, the water thereof is much used to breake the stone, expell the gravell, and breake the winde: the true Mahaleh of Syria, was millaken by Serapio to be the Phyllyrea of Dissorides, when as the properties are much differing, for Mabaleb doth heate and mollifie, even by the teltimony of Melus and Rafis, and as Avien faith, doth clenfe, attenuate and refolve and ease paines: The oyle drawne from the kernels, doth much more ease the paines in the bowels and backe, being annoynted, then the kernels themselves which some use for the said purpose, and for soundings, and faintings, to be taken with Mede or honyed water, and doe helpe the chollicke and stone in the kidneyes, kill the wormes in the belly, and provoke urine also.

CHAP. LXXXIV.

Cornus. The Cornell tree.

He Cornell is divided into male and female; the male is of two forts, one bearing red berryes like Cherries, and another whitish: the female hath no diversity. 1. Cornus mas fructurabre. The male red Cornell tree.

The Cornell or Cornellian Cherry tree groweth to be a reasonable tall and great tree, the body and branches are covered with a rugged barke, and the younger imooth, whereon grow imooth leaves, and plaine not dented at all about the edges, the flowers are many imall yellow tufts, as it were thort threes fet together, which come forth before any leafe, and to fall away likewite, before the leaves appeare much open: the fruite are somewhat long round berries, of the bignesse of small Ollives, with a small hard stone within them, like unto an Ollive stone, reddish when they are ripe, somewhat like a Cherry, of a reasonable pleasant taste, somewhat austere withall: the wood is hard like an horne, and groweth slowly. Of this kinde Clufius maketh another fort, with redderberries, little differing in any thing elfe: and another that groweth low, but yet hath beene observed upon the transplanting to grow much greater.

2 Cornus mas fruitu albo. The white male Cornell tree. This other Cornell differeth not from the first in any other more notable matter then in the fruit, which becommeth not fo red, but whitish when it is ripe.

3. Cornus famina, The Dogge berry or Gatten tree. This never rifeth to be a tree of any bulke or body with us (but Classes faith that he faw in the Woods of Anfria, as bigge trees hereof as of the male, and Bellonian faith the fame lib. 1. c. 56)bur usually abideth as an hedge bush with many pithy strong twiggy stemmes rising from the roote, of a brownish colour and the sprigges more reddish, with a pith within them like unto Elder, having leaves thereon somewhat like the former, but a little shorter and broader, standing upon reddish sootestalke, and the middlerib reddish likewise, the flowers are white and fland at the end of the branches, many growing together in a tuft or umbell, upon reddift footestalkes which turns into small berries, green at the first, and shining blacks when they are ripe, of a most unpleasant bitter. tafle provoking casting.

The Place and Time. The first is found wild in many places of Germany, and the other forts hereof also, but the second is more 1. Comm m 16 frulla rabro. The male red Cornell tree.

3. Cornus femina. The Dogge berry or Gatter tree.

methe last groweth in every Country of the Land, serving for a hedge bush; the first flowreth very earely, as ubefore said, in March, and sometimes in February, the fruite is ripe in August. The last flowreth not untill May, and the fruite ripeneth not untill September be well over.

The Names. The first is called in Greeke regresa in Latine Cornsu and mas, to distinguish it from the other, which is called by Theophraften Indunegavia Cornus femina. There is much doubt and queltion among many of our later Writers, about this female Cornell (for of the male there is no doubt, all catting it Cornen mas, or fativa,) whether it should be the Virga Sanguines of Pliny, or the Harriegell of Tragus, or his Faulbaum, some referring it to the one, some to the other, but the generall tenet of the molt is, that in most things it answereth both to the Thelyrania of Theophrassus, and may well enough agree with the Virga sanguinea of Pliny: Cordus calleth it Pseudo-rania quaffalsa Corum, and Dodonam, besides that he calleth it Corum samina, taketh it to be the Opulau Coluwelle. Bellowing faith in the 36. Chapter of his first Booke of Observations, that he found that shrub, which the French in imitation of the latines call des Sanguins, and the aunciert Greeke Cornus femina, betweene Philoppor, and Buet phale to be little integiour unto our greatest male Cornellian trees, thereby esteeming them to be or, and Described to Designe interious unto our greatest male Concellant trees, thereby elicening them to be both one i. The Italian at Matchiella faith, call it Sanguineo, and Sanguinello, but whether it be Tragm Hartriegel, we are not well afforced, for he faith that the wood thereof is fo hard that it can very hardly be bored, and therefore ferryeth for many Country informents, and long latting for the hardueffe, which we can not fay fo of this, we for the most part easily it the Dogge berry tree, because the berries are not fit to be eaten, or to be given to adogge. I heare they call the Engagness for the Land, the Gatter tree, and the berries Gatter berries, yet some say they call the Engagness for

The Vertue:.

The male Cornell is a fraint yety good and wholesome, pleasant with the austerity, and helping to binde the belly subject or molested with a laske; both leaves and buds saith Galen, doe dry exceedingly, and therefore are good to loder up great would in strong bodies, but not so fit in small cuts, and more tender persons, because it dyetheod much in such cases. The Conserve made of the fraire, is of especiall use in all stuxes both in man and woman, the liquour that commeth out of the leaves or ftalkes, being heated with an iron, that the iron touch them not, is good to heale acters, and ring wormes. The Female Cornell or Dogge berry, is put to no use that know, yet Matthiolus saits that the people in Italy, by boyling the berries, make an oyle that serveth for their lampes. If one that is cured of the biting of a madde dogge, shall within one twelve moneth after touch the Comm famina, or Dogge berry tree, or any part thereof, the difeale will returne againe. Schinkins obforwation.

CHAP. LXXXV.

Lotm. The Lote or Nettle tree.

Lthough divers Authours have published sundry trees, under the name of Losm, as Injuba, Laurocerafin, and many others, yet there is knowne unto us but one true kinde, that is called Losm, the Lote or Nettle tree, yet I thinke not amisse to joyne two or three other plants, which may not unsitly be reterred to it.

I. Lorm five Celtin arbor. The Lote or Nettle tree.

The true Lote or Nettle tree groweth to a great heighth, whose body and elder branches are covered with a smooth darke greene barke, the younger being more greene, whereon grow somewhat rough or hard leaves, long pointed, and somewhat deepely dented about the edges, like useo a Nettle lease, of a darke greene colour, and often grow yellow toward Autumne: the slowers stand here and there scattered on the branches, after which come round berries like unto Cherries, hanging downewards upon long sootestalkes greene at the first, which afterwards, and reddish when they are full ripe, but blackish if they be instructed to hang too long on the branches, of a pleasant austere rashe, with an hard round stone within them. There is said by Theophrash mais this be his sirst.

Lotum, to be another fort without stones, whereof Wine was made, that would not last above two or three dayes.

2. Arbor Guajacana five Guajacum Patavinum. The Indian Date Plumme tree.

The Indian Lote tree groweth great, with a smooth darke greene barke, shooting forth many large boughes, and slender green branches, beset with faire and somewhat broad green leaves, somewhat like unto the leaves of the Cornell tree, but larger, without any dents on the edges, the slowers grow along on the branches, close set unto them, without any or with a very short sootestalke under them; consisting of soure greene leaves, as the huske, and soure other within, of a darke purplish red colour, the fruite that followeth standerh in the middle of the said huske, closing it round at the bottome, and is greene at the first, and very barsh, but red and round when it is ripe, and somewhat like a Plumme, with a small point at the head, and then of a reasonable pleasant taste or rellish, wherein in the hotter climates, but seldome in ours or not with me; are consained thicke and flat browne gristely seedes or kernels, somewhat like unto the kernells of Cassia Fistula, which may be somewhat easily cut with a knife.

3. Guaj cum Patavinum angustifolium. The Indian Date Plumme tree with narrow leaves.

This differeth little from the last, either in stemme or fruite, but onely in the lease, which is longer and larger then it.

Lotus arbor.
The Nettle trees

2. Guajacum Patavinum. The Indian Date Plumme tree.

3. Guala un Paravinum augustoribus jolijs. The Indian Date Plumme tree with narrower leaves. 4. Pishanim Virginianum.
The Virginiau Date Plumme or Pishamin.

4. Pilhamin Virginianum. The Virginia Date Plumme or Pilhamin.

This other kinde, which differeth but little from the second (if it be not all one with it, or at least a greater fort; whereof I am more then halfe persuaded, they doe so neere agree together) hath growne also with me, raised some the kernell were sent with the fruite out of Virginia, and grew in a short time to be of seven or eight soote light (which upon remooving perished) but there groweth to be a great tree, whose wood is hard and brittle, and smewhat whitish, but covered with a thin darke green barkethe branches are many and slender, with a thinner gayish barke on them, whereon are set many faire broad greene leaves, without any dent on the edges, and very liteuato the former. It hath not borne slowers or fruite in our Country that I can heare of as yet with any, but he fruite as it came to us, was in forme and bignesse like a Date, covered with a blackish skinne set in a huske of buttem, very like unto the former, but larger by the halfe.

The Flace and Time.

The first groweth in Italy in divers places, naturall as it is faid: but in many especiall places there, and in Protector France, and Mompelier, growne great trees, and so also in some places with us: The second came to me trom Italy, by Master Doctour Iohn More: and groweth now in my Garden, but came as it is said out of the West Indies, for Dalechampus had it from Florence, where they called it Uva d'India, and planted it about lust in France: The last as I said came from Virginia: The first flow sethearlie, and ripeneth the fruite also some tenthen the last.

The Names.

The Lote tree is called in Greeke \(\times \omega \times \omega \epsilon \omega \

a. Pifiana

I. Lentifens. The Makicke tree.

2,3. Lentifus Perwana & Molle Clufi ferrath foliis.
The Indian Mallicke tree, and the Indian Molle formewhat like it-

Guaracum, and Lobelthat taketh it for Lotus vera. Matthiolm calleth it Pfendolotus, and faith that it came from Angerius de Busbecke, who fent it from Constantinople by the name of Datiyli ex Trapesonda dulces, but affored. ly either Busbeck or Matthiolis were deceived therein, a contrary fruit being given them under that name, for the name agreeth not with his description, which is indeed the description of this Guajacum, for by that name of Trabison Curmes Bactylus ex Trapezunte, hath the Laurocerasus beene tent from Constantinople, as both Came. varius and Clufius doe let it downe, which is much differing from this. Camerarius and Bellouins calleth it Guajacana, Calalpinus Ermellinus, who also taketh it to be the Tuberum alterum genus Pliny. Lugdunensis as I faid before, taketh it to be the Diospyros of Theophrastus, lib.3.c.13. and the Faba Graca of Pliny. Matthiolus calleth the third Lotus Africana altera, or Lots Afriana species. The last hath the name in the title, as it came to us, and for the likenesse I doe set it with them, if as I said it be not the very same: and is also likely to be the Loti Africane altera species, as the figure thereof plainely sheweth. The Vertues.

The berries of the Nettle tree doe binde the belly, and the shavings of the wood made into a pouther and drenke, or boyled in Wive or water and druske, helpeth women that are troubled with the abundance of their courses, and the laskes of the belly also: the same decoction maketh the haire to become yellow, and staveth the filling of them. The fruite of the other while they are greene and unripe are so harsh as they are able to draw their mouthes awry that shall eate them, but when they are full ripe are reasonable sweet and pleasants but what other property they have, I have not yet understood.

CHAP. LXXXVII.

Lentiscus. The Masticke or Lentiske tree.

He Arbores resinifera, come next to be entreated of that is, those trees that beare Rossin-like Gummes, which are divided into two forts, that is, into thole that beare berries, and those that beare Cones. The berry bearing trees are these Oxycedrus, the prickely Cedar, Cedrus Lycia, the Cypresse like Cedar, the greater Thd the lesser, Sabina nevaque, both forts of Sabine. Inniperas major, the greater luniper tree, of all which I have before in this worke spoken, some adde Taxus the Yew tree, but I see no reason for it. There remaine some others to be intrested of and

the Mallicke tree fielt, whereunto I thinke meete to joyne two other strange trees of the West Indies, which are referred hereunto for their likenesse; the rest of them which are the Turpintine tree, the Ballame tree, the Storax tree, and the Dragon tree shall follow each in their order.

1. Lentifens. The Malticke tree.
The Malticke tree groweth like a tree, if it be suffered to grow up, and often also rifeth but as a shrubbe, whose body and branches are in colour alike, that is of a reddish colour, tough and gentle: and doe fomewhat bend downe their ends, whereon grow winged darke greene leaves confilting of foure couple, each of the bigneffe of the large Myrtle leafe, standing one against another, without any odde one at the end, with a reddish circle a-bout their edges, and some reddish veines on the underside also, smelling sweete and abiding greene alwayes on the bushes, the flowers grow in clusters at the joynts with the leaves, being small, and of a pale purplish greene colour, and after in their places stand small blackish berryes, of the bignesse of Pepper cornes, with a hard blacke shell under the outer skin, and a white kernell within, it beareth besides these berries certaine hornes, with a certaine cleare liquour in them, which turneth into small flyes, that flyeaway : it giveth also a cleare white gumme in small drop; es, when the stockes are wounded in sundry places, which is gathered with great care and attendance.

2. Lentiscus Pervana. The Indian Masticke tree. This Indian Masticke groweth as high as any high Masticke tree, spreading long and pliant branches, bending downewards, covered with a tough reddish barke, set with long winged leaves, made of many leaves, set by couples, with an odde one at the ends, of a fad greene colour, and a white ribbe in the middle, with rugged veines transversing them, conspicuous chiefely underneath, being plaine and not dented about the edges, and being bruifed have no evill fent : the flowers come forth in sparfed tutts together on a stalke, an handbredth long, confisting of five small white pointed leaves a peece, after which succeed small round berries, like those of the former Maflicke tree, upon fhort footestalkes, of the bignesse of Pepper cornes, greene at the first, red after, and blacke being ripe, and as tharpe and hot in tafte as Pepper, somewhat oylie, covered with a thin skinne, and the inward kernell of a very sharpe sent and tafte. We have had a cleare white gumme in great lumpes or peeces brought us from some of our English plantations in the West Indies, which they called Masticke, and in the chewing was tenacious like Masticke, whether the tree from whence it was taken was answerable to this or the next, we are not certaine, because there was no relation sent thereof unto us with it.

3. Lentife Pernant fimilis Mole dida. The Indians Mole.

Clusius maketh mention of a tree called Mole, received from the West Indies, which as he faith might be the same with the former and differing but in age, but because there seemeth manifest difference betweene them, I thought good to sever them, and shew you it with this description that he hath given it. There rose saith he, two fmall plants, with the worthy Signiour lohn Brancion, at Mechlin, from feeder that were called Molle by the West Indians, but perished by the excremity of the Winter, the third yeare after they sprang up: but the stems of them being young, were of a darke greene colour, with divers small ash-coloured spots thereon, the leaves were winged like those of the Ash, but much smaller, of a darke greene colour, dented about the edges, and the end leafe longeil, yeclding a white, thicke, and glutinous sweete milke when they are broken, and being bruised fmell like Founell, having an aftringent tafte : it gave no flowers, but Lebel sheweth the flowers were yellow, but the berries that were fowne and forung, were as bigge almost as Pepper cornes, covered with a reddish skin, and clustering together like unto a small cluster of Grapes: the gumme hereof is said to be sweete in smell.

The Theater of Plants.

The Place and Time.

The first groweth as well in Provence of France as in divers places of Italy, and in Candy also, and in many places of Gracia, but yeeldeth little gumme there, but especially in the sile of Gio, now called Sio; they tend, pruine, and manure it with as great paines and care, as others doe their Vines, which goeth beyond them in the profit of the gumme: It flowreth in Aprill, and the berryes ripen in September, and not at severall times, as these Verses of Aratus would intimate.

Jam vero semper vividis semperque gravata Lentiscus, triplici solita ost grandestere fatus Tor fruges sundens, triatempora monstrat avandi,

As it is there fet downe. The second was brought from America, and grew, as Banhinus relateth it, in Cardinall Columna his Garden at Rome, where it grew great, which also as it is likely was the same that Clusius saith Everardes Verfities faw there, and as he faith likewife Doctor Tovar of Sivil in Spaine, fent him fuch like branches with the unripe fruite in clusters to see, but as he faith; called Molle by Tevar; Lobel also exhibiteth a branch hereof with the mext that is dented, at the beginning of his tractate de Balfame: Clusium himselfe also having gained abranch hereof from some place not specifyed, setteth it downs as taken from a tree growne old. The last is mentioned likewise by Clusium in his Amortations upon Monardum, to grow as all the Chronicles, or Writers of the Welt Indians fay, in all the Vallies and Champion grounds of Peru, and efcecially Cieza. Petrus Writers of the Weit Indians say, an an de Ofma also in his Letter to Monardus faith it grew at Lima in Pern.
The Names,

The Masticke tree is called in Greeke No (not Siro which is Innem odoratus) quafi 25th fiftis quod facile & frequenter in dentiscalpia findaeur, and the berries geridui and not exiridu, as some coppies have it, in Latine Lentisess afeliorum lestore fortaffe by which name all Authours call it, and the gumme Refina Lentifeina, and Maftiche, and Maftix by some, by the Arabians Gluten Romanum; Diofeorides maketh mention of a greene gumme as well as a white, and Galen of a blacke fort that was of Egypt, both which are not knowne in these dayes: in Condy and some other places, their trees yeeld a yellowish bitter Masticke, but no where so good, and to plentifull in all the world, as in the Isle of Sio in the Egons Sea: there is another fort of Malticke which is called Acoustice, or Spinatio as Gaza translateth it, because it is gathered from a prickly thistle, as I have thewed among the Thistles, in the Chapter of Chameleon and Carling. In former times our Apothecaries shops were furnished with no other Aylobal somm, then the springs of Lentifens, I would the errour might not be conwere numined with no other Ajumanjanama, then the aprigs of Lenijeas, I would the errors inguithor be continued: The second is called Molle by Towar, as I said before, and by Cluffers in his Care posteriore; but by Bashims Lenifeas? Pervisas, and tollowing Cluffers listh, that it beareth the leaves according to the growth, being denied while it is young, and without dents growing older, which how difforms the other, for the old that is plant let of the proving the she from the other, for the old that is dentéd

The Turpintine tree flowring and with the home thereof.

1526 CHAP.88.

dented hath an end leafe, bigger and longer then all the rest, which showeth I am perswaded a manifest difference in specie, from this that is not dented, for I cannot be perswaded that any plant, should so much differ in forme from it selfe in the time of age and youth. The last is also as I showed called Molle by the Indian Witters, whose sent is like Fennell, when as the other is not so, and is for the likenesse referred to the Lentiscus Forman by whose sin his Mantholomy. The vans by another in his Mantholomy. The control of the supplies therein, to be both one, & by Lobel joyned with the former and the Ballamann verum, making it to agree with the properties therof in many things, Baptise Forman also in his Flora mentioneth it by the name of Tercanishma angustifolia page, 372. citing the third Book, and 17. Chapter of that great Book of the West Indian plants, bealts, accepting to be Printed more theatwenry yeares ago at Rome, whose great Book of the West Indian plants, bealts, accepting to be Printed more theatwenry yeares ago at Rome, whose title is I besarrar rerum medicarum nova Hispana, &c. The Arabians call the Lentiske tree Darn, the Italians Lentisco, the Spaniards Mata and Arveria, the French Lantique, and those of Narbone Restincte, the Germans Massichaum, the Dutch Massichoom, and we in English the Lentiske or Massicketree.

The Vertues.

The Lentiske tree is binding in the second degree, or in the beginning of the third, and temperately het : all the parts thereof are binding, that is, both roote and branch, both barke and leafe, both fruite and gumme, and dee binde and stop all fluxes, and spittings or castings of blood, and is good to strengthen a weake stomacke, and helpe the falling downe of the mother or fundament : the decoction fomented, healeth up hollow fores, and fodereth broken bones, fasteneth loose teeth, and stayeth creeping fores, and doth as much as Acacia or Hypecistic. and even the juyce of the leaves is as good a substitute for Acacia as any other: the oyle that is prefied out of the berries, helpeth the itch, the leprofic and leabbes, both in men and beafts: the gumme Masticke doth binde and stay fluxes in like manner taken any way in pouther; or if three or foure graines be swallowed whole at night when you goe to bed, it not onely eafeth all paines in the stomacke, but keepeth it from the like afterwards, the pouther of Masticke with Amber and Turpinte is good against the running of the reines, and for both whites and reds in women: the pouther thereof mixed with Conserve of red Roses, helpeth softsy the destillations of ulcers, and fores, to stay the fretting fluxes of fluxours to them, to dry them up, and to fill up the hollownesses it strengthnesh and bindesh also the parts, whereunto it is applyed, and comfortesh the aking joynts and sinews wonderfully. The oyle that is made of Massick by infusion and ebullition, secundary areas Pharmacentican, is singular good in all the aforesaid diseases, moderately comforting, mollifying and binding, and is effectuall against all the aforesaid diseases of the mother, against all paines in the belly, colon the chollick, and the stomacke. the hardnesse of tumours, and the paines of the joynts and sinewes, it likewise comforteth the braine, and strengtheneth both the liver and heart, but one droppe of the pure Chymicall oyle drawne from Masticke is more effectuall then one ounce of the former cyle, for it deserveth more commendations then is given it. The effects of the Indian Molle is recorded by those have written of it first, that of the berries, they make a wholesome kinde of Wine or drinke being boyled with water, and according to the boyling of them either vinegar or honey; the decoction of the leaves is good to helpe cold griefes, and applyed warme to woundes after cloathes be dipped therein helpeth their cure more speedily, the pouther of the barke also of the tree, trewed or cast into them doth clenfe, ingender flesh, and heale them quickely and perfectly: with the decoction also of the barke, the swellings and paines of legges and thighs, are much comforted and helped; the faid pouther of the barke doth helpeto faiten loose teeth, and loose gummes, and of the wood is made fine and good tooth the kes: the gumme dissolved in milke and dropped into nhe eyes taketh away the dimnesse or millinesse of them.

CHAP. LXXXVIII.

Tere binthu. The true Turpine tree?

Lithough Baubinus in his Pinax doth make three forts of Turpintine trees, taking his ground from Randows who maketh two forts befides the ordinary one, yet I am of Clusius his opinion thas the greater fort is the Terebinibus Indica of Theophrassum, which is the Pissake tree mentioned before, so that the other two forts we hold well to be differing Turpintines with other good Authours, and to be here described unto you; yet we doe not intend to diffiguish them by mus and samples as Theophrassum doth, that the male is barren, and the semale fruitefull, the one bearing red berryes which come not to ripensite, and the other greene at the first, red afterwards, and blacke, and of the bignesse of a Beane when they are ripe; but Clusius laith, that enquiring diligently thereafter, he could heare of no such differences, unlesse it may be said to be a difference when some fruite trees bring their fruite to ripensite, when others are empty or idle, by some casualty or ill standing: but by the leaves, the one bearing broader and the other narrower leaves.

I, Terebinshus laisfolia. The broader leafed Turpintine tree.

This Turpintine tree in many places groweth but like a shrubbe, yet in some to be a great tree, the barke of whose body and greater branches, are of an ash colour, the lesser being greenish, and red while they are young, springly set with large winged leaves like unto the Pistacke tree but larger, every lease being as great as a Bay lease, and pointed, not round which putteth the difference betweene them, and smelling somewhat like a Bay, falling away, and not holding on is Winter: the flowers are mossic like the Ollive blossomes, and grow on long stalkes comming out of certaine knots, from the ends of the branches, a number of them in small miss set in a cluster together, of a purplish browne colour, which passe into small berryes, somewhat bigger and longer then those of the Malticke tree, and very like unto the true Carpbal samen, greene at the first, redsish after, and of a blewish colour, tending to greene when they are ripe, glutinous in handling and sticking to their singers that touch them, having a kernell within them amount of those berries that grow red before they it is joe, fall away being tempty

emp:y and idle: this beareth also certaine red hollow skinny bladders, like long hornes, full of a clammy blackish liquour, which breed small flyes or gnats in them: This being wounded in sundry places yieldeth forth a liquid
Rossen or clearer Turpentines, but nothing so thinke as that of the Larch tree.

Terebinths cour flore of chains, and the state of the larch tree.

The Theater of Plants.

2. Terebinshin angustiore folio vinigatiore.
The narrow leated Turpintine tree.

TRIBE 16.

This tree is in all things like the former, but that it never right to high, and the leaves are long and narrow, much smaller then the former, the berryes are many of them red on the stalkes at their full right, which declareth them so be empty huskes, and no good seed, and but some that will be full and good.

The Place and Time.

The Tarpintine tree groweth in Narbone, and Provence in France, in findry places of Raly, and Spaine, Cyprus and Greece, where for the most part it abideth small, and low, but groweth very great and high in Syria, Arabia, Cilicia, Armenia, and other those Levane Countries, as Bellonium hath observed: the second as Lobel saith, is much the more frequent in all the places about. Prospence: They shower somewhat earely in the Spring, and the fruite is ripe in September and Ostober.

The Names.

It idealled in Greeke riguides, and in Latine Terebinthus, and the Turpintine jurieur reguirent, refina terebinthina, the true Turpintine tree was not knowne in divers of these later ages before ours, for as Matthiolus shith, the liquid Rossen of the Larch tree had by time obtained the name of Turpintine, and so was used, no man thinking that there was any truer to be had, until the search of diligent men, had brought the true Turpintine to light againe, that so long time had lyen hid from our Predecessors. The first is the Terebinthus of CMatthiolus, Lugdonensis, and others, and the Terebinthus lantifici folic of Lobel. The other is the Pistablas solic of Lobel, and the Terebinthus major of others. The Analisms call it Bosin and Albotin, the Italians Terebinto, the Spaniard Cornicabra, the French Tereminthe, the Dutch Tereminty boom, and we in English the Turpintine tree.

The leaves, the barke, and the fruite of the Turpintine tree are hot and dry in the second degree, and doe binde, strengthen, and repell, but the Turpintine doth heate, clenfe, and purge, draweth, and mollefyeth and excelleth all other Rossens, yet Galen for the property Mellicke, that is, in hinding and from

some causes preferreth Masticke, that is, in binding and strengthening; the berryes being dry are very neere unto the third degree of drynesse so that they provoke urine; and are good for the spicene, and for the biting of the Spider P balangium: of the berryes is made an oyle, as out of the brityes of the Lentisk etree, which heateth and bindeth, and is good in crampes, convulfions, hatdneffe of the finewes, and to close wounds a the berryes themselves are much eaten by the people in Turkis where they grow and make them their daily food, warming, comforting, and opening the uritory passages, and withall provoke lust: the Turpintine heateth, mollefyeth, resolveth, digesteth and clenseth: if a dramme or two te taken in a reare egge it wonderfully helpeth the cough, which commeth by flegme, stopping the lungs, wheelings, and shortnesse of breath and all imperfections of the chest by flegme: it clenseth the backe and reines, and stayeth the gonorrhæa, with a little dryed Rubarbe in pouther put thereto: it provoketh urine, and helpeth to breake and expell the frome and gravell, it ripeneth Imposthumes and helpeth to expell them, and mightily dissolveth winde in the paines of the chollicke, of the stomacke or sides, and is good also against the gout, Sciatica; and all paines in the joynts, as well to take it inwardly with some Chamepin, Sage, and Stechai, as to be made into a searcloath and applyed therets: it is a speciall ingredient inrothose Balsomes that are to heale any greene wounds, and is fingular effectuall is all wounds, and fractures in the head, all punctures in the flesh or finewes, and all breakings out in the skinne, be it itch or scab, be they piles, pushes or wheales: it draweth forth splinters, thornes or the like out of the field, and healeth the chaps of the lips, hands, fundament or other parts: briefely it is put into all salves, oyles, oyntments, or plaifters, that ferve to clenfe ulcers, to draw and heale any fores, or to warme and comfort any told or weake parts: thefe things the true Turpintine performeth better then any other, which from hence hath drawne both the same and use: the Chymicall oyle of this Turpintine is wondrous effectuall in many of these diseases, if it be carefully applyed, for it is by farre of more subtill parts, being the purer and more subtill spirits, whereby they heate and penetrate much more, and therefore inwardly or outwardly must be used in lesser quantity, and as it were but by drops. There are in the Easterne Countries of Turkie, as Bellonius recordeth, much use made of the young hornes of the Turpintine tree, before they are growne great, for he faith many thousand pounds weight of them are gathered while they are no bigger then Gaulies, to lerve the Dyers there to dye their filke; which shall hold the colour fresher and firmer then any that is Dyed without them,

Balfaman genninum amiquorum.
The use Balme or Balfaman tree of the ancients.

CHAP. LXXXIX.

Balfamum gennium antiquoqum. The true Balme or Balfame treë of the ancionts.

O deliver unto you this Balfame tree as I should, and as it ought and deserveth. I somewhat doubt of my ability, for who is fit for so rare, so excellent a subject, being heretofoge accounted as one of the greatest jewels, and richest endowments of the earth, and as a parcell of the treasure of great Kings, and Princes, and it is thought by many that the greatest and warthyest present that the Queene of Shela did or could bring and give unto King Salomon, was some Balfame trees, which she brought out of her Country,

that Salomon might plant them in his : and it was also one of the greatest lewels the first Prolomoy could bring away from thence into Egypt, as Authours doc record it : but now the times are fo changed, that I thinke I shall scarce gaine credit, that the same true Balfamum is extant in rerum natura: but least my gates grow great ter then my City, and so it runne out at them, let me leave any further preamble, and shew you the thing. The Balfame or Balme tree, never groweth very great, no not in the naturall places, being fuffered to grow as it will, but unto five or fixe cubits high or thereabouts, and in others much lower, with divers foral and straight flender branches issuing from thence, of a brownish red colour, especially the younger twigs, covered with a double barke, the red outermost, and a greene one under it, which are of a very fragrant smell, and of an aromaticali quicke tafte, some what aftringent and gummy, cleaving to the fingers, the wood under the barke being white, and as infipide as any other wood; on thele branches come forth sparsedly and without order fundry stalkes of winged leaves, formewhat like unto a those of the Masticke tree, consisting forme but of three leaves which are those that first come forth and the lowest, others of five or teven leaves, and feldome above, which are fet by couples, the lowest smallest, and the next larger, and the end one largest of all, of a pale greene colour, smelling and tasting somewhat like the barke of the branches; a little clammy also, and abiding on the bushes Winter as well as Summer: The flowers are many and small, standing by three together on small stalkes, at the ends of the branches made of fix small white leaves a peece, which are succeeded by fmall brownish hard betries, little bigger then Iuni-per berryes, small at both ends, crested on the sides and very like unto the berryes of the Turpintine tree, of a very tharpe fent, having a yellow hony like substance within them somewhat bitter, but aromaticall in taste. and biting on the tongue like the Opobalfamen: From the body hereof being wounded, commeth forth a li-

The Place and Time.

Arabia falix about Mecha, and Media a, and a small village neere them called Bedrania, with the hils, vallies, and sandy grounds about them. and the Country of the Sabasu next it, are thought by many to be the onely naturall places, where this tree hath beene ever knowne in these or the former days to grow, and from thence hath Indea and Egypt ever beene surnished, whatsoever hath growne therein as Alpissus relateth; but it is somewhat probable to me, that the hils of Gilead did nourish this tree long before the Queene of Shaba brought any as it is thought to Salomon, in that the Isamilies that bought selected, and serving the carry from Gilead, Balme &cc. downe to Egipt, and Gen. 4.3. II. Jaceb willeth his Sonnes to carry to lesph in Egipt, some of the best fruites of the Land, so. Rossin &cc. which I take to be understood this Balme, or else Rossin simply might be thought too simple a present for Island, and not one of the best fruites of the Country: but I doubt of the truth of that tale that the Queene of Shaba did first bring the Balsane trees to Salomon, and that he planted them in the valley by Isricho, but rather that they were fetched from the hils of Gilead, and planted by him there in Orchards, the better to be tended. Isremy the Prophet doth also often mention the Balme of Gilead, and yearely pruised both by the Iswes and Arabians, to have the greater store of liquor-It slowreth in the Spring with the Turpintine tree, and fructiveth with it in the Autumne.

From the Arabians who call it Balesan, have the Greeker called it Bahrajur, and the Latines Balsamme: the liquous

iquour they call ὁποβαίνσιμον Οροβαίζαπημα, or βαίνσιμολαίν Balfameleon, and the berryes or fruite of the tree iquos βαίναι μον Carpobalfamum, and τραπιμον Caffamum, and the springs or young branches thereof ξυλοβάλσαμαν Χημοβαίναι μον Carpobalfamum. Divers of the auncient Writers have made mention of this tree, but so diversly that many do thinke they wrote of a thing that was not, or that was not seene and knowne unto them, at the least the descriptions are so lame and seeme so to vary one from another, yet if they be warily and wisely considered, they may be brought in some fort to agree thereunto, but for me to argue much in this matter, and the particulars would require a great deale of time and roome, which cannot be spared here, I must referre them to Alpinas and Bellonish, that would be further satisfied herein, who have more largely entreated of this subject.

The Vertues.

This Ballame tree faith Galen, is hot and dry in the second degree, so that it is sweete in smell being of thinne parts: but the liquor or Opobalfamnm, is of more thinne parts then the plant it selfe : the fruite or berryes is very like it in quality, but farre inferiour thereunto in the fubtility: The liquour or Opobalfamum, is of great good me against all poysons and infections, both Vipers, Serpents and Scorpions, the pestilence and spotted severs; and all other putride and intermissive agues that rise from obstructions, and crude cold humours, to take a scruple or rwo in some drinke for some dayes together, and to sweate thereon, for this openeth the obstructions of the liver and spleene, and digesteth those raw humours in them, cherishing the vitall spirits, radical moisture, and natural heate in these and is very effectuall in all cold griefes and difeates of the head or ftomacke, helping the I wimmings and turnings of the braine, weake memories, and the falling ficknesses it cleareth the eyes of filmes or skinnes. overgrowing the fight, and easeth the paine in the cares, and their deafenefic and other diseases, to be dropped into the eyes or eares, it helpeth the cough shottnesse of breath, and consumption of the lungs, by warming and drying up the distillations of theumeupon them, and all other diseases of the stomacke proceeding of cold or winde, the cold or windy diftempers also of the bowells, wombe or mother, procuring torments and paines, or the cold moistures procuring barrennesse, procureth the courses, delivereth the dead birth and after birth; the flux also of the whites and the stopping of urine : it clenseth also the reines and kidneyes, and freeth them from the generation of stones in them, and expelleth the gravell or stones in them; it is singu'ar good against the palfie, crampe, tremblings, convultions or fhrinking of finewes, and for greene wounds, the most speedy operatour of any : from the lingular effect whereof all other medicines made for the health of the body or to heale wounds were called Balfamum, Balme. The women in Egypt, herewith as Alpinm theweth, preferve their beauty, and young forme for a long time, the berryes are especiall good against poylons and infections, the falling sicknesse. the fwimmings and paines in the head, the cough, and diseases of the lungs, the windy paines and stiches in the fdes, the restrains of urine and the rising of the mother and other diseases thereof to sir in a bathe made of them i the wood worketh the fame effects but in a farre weaker manner.

Segran arbor. The fweete Storantree.

TR 1 BE 16.

Efides the Storax tree, that hath usually been knowne and described by allmost all Writers of Herbs; and which I am now about to shew you, Banbinus from Honorius Bellus in Candy, hath exhibited another sort, whereof he is so briefe, that little more can be assured thereof by his relation, then the name, and the considence of his judgement from whom he had it, that it may be referred hereunto. A third sort is the Storax rabra. Whereof we have leffe knowledge then of the last.

The storax tree.

1. Styrax arbor vulgaris. The usuall Storax tree.

This Storax tree groweth very like unto the Quince tree, both for forme and bignesse, the leaves also are long and roand, and somewhat like but farre lesse, whitish underneath and stiffe. The slowers stand both at the joynts with the leaves, and at the ends of the branches, consisting of sive or sixe large whitish leaves, like unto those of the Orrenge tree, with some threds in the middle, after which come round berries, set in the cups that the flowers stood in before, of the bignesse of Hasell nuts, pointed at the ends, and hoary all over, each standing on a long in stood in before, of the bignesse of Hasell nuts, pointed at the ends, and hoary all over, each standing on a long stood stalke, containing within them certaine kernels in small shells: this yeeldeth a most fragtant sweete gum, and cleare, of the colour of browne hony, if we might have insincer without mixture, which yet wee in small drops have had.

2. Styrax folio Aceris. A Storax with Maple leaves.

From a round blackish rugged roote covered with a crested, or as it were joynted barke come forth out of knots three or five broad leaves like unto those of the Maple or Plane tree, standing on small blackish long stalkes, and are divided in three or five parts, full of veines dented about the edges, and pointed at the ends.

This thing that formerly was called Storax rubra, was a barke of some kind of tree, and thought to be the Nascaphibum, or Nascaphibum of Dioscorides, but Cordun on Dioscorides scanning the matter somewhat more seriously determinethic to be a thing utterly unknown to him in his time, and by the cheapenesse of that barke only determinethic to be a thing utterly unknown to him in his time, and by the cheapenesse of that barke only determinethic to be a thing utterly unknown to him in his time, and by the cheapenesse of that barke that went under that name, saith plainely it was too cheape to be right, Dioscorides making Nascaphibum, to be that went under that name, saith plainely it was too cheape to be right, Dioscorides making Nascaphibum, to be that which was called Tigname in shops, which as he saith the Italians called this but taketh Nascaphibum, to be that which was called Tigname in shops, which as he saith the Italians called Agallacho, that is Lignum Aloes, and so Cordun also saith, that one Iohannes Rodericus a Portugalitooke the Agalacho, that is Lignum Aloes, and so Cordun also saith, that one Iohannes Rodericus a Portugalitooke the Agalacho, that is the same with Lignum Aloes, being a wood and the Nascaphibum a barke, aloes, as a foresaid, but Cordun milliketh that opinion, the Lignum Aloes being a wood and the Nascaphibum a barke, yet although this long discourse be somewhat from the matter in hand, yet seeing it fell so firtly to speake of Nasyet although this long discourse be somewhat from the matter in hand, yet seeing it fell so firtly to speake of Nasyet although this song discourse be somewhat from the matter in hand, yet seeing it fell so firtly to speake of Nasyet although this song discourse be somewhat from the matter in hand, yet seeing it fell so firtly to speake of Nasyet although thereof, in that as I said divers sooke it to be Storay make, when as no auncient Authour mentioneth it: but both Serapic and Avicen divide to be Storay make, by liquida understanding the pure gumme sowing fr

which we have now adajes by that name, and by the feca, the feces of the expressed oyle from the fruite, but some of our modernes take the Calumita to be Rubra. The Place and Time.

The first groweth in Provence, of France in Italy, Candy, Greece, and other these hither parts of Turkie, where it yeelde.h no gumme, but in Syria, Cilicia, Pamphilia, Cyprus, and other of those hotter Countries, it giveth much but is so adulterated that I thinke scarse none in our age hath feene any fincere come over unto us, as by that fincere stuff, that which we have drawn out of the best gumme we could get, is plainely to be discerned, so much groffe faces remaining behind, after the expressi. on, and by the comparing of it with Dioferides his notes: It flowieth in the Spring, yeelding fruite in September, the other Baubinus as I taid, had it from Bellus of Candy, but where it grew is not fignifyed.

1530 CHAP-90.

The Names. It is called in Greeke week, and in Latine Styrax arbor, as the Gumme is called Gummi Styrax, or Storax, and in shoppes Storax of Styrax Calamita, which for what cause it was so called, Galen declareth, that because the best and most sincere came from Pamphilia. they used to put it into Canes, the better to preferve. not onely the fent as most fay, but even the substance too, as I thinke, for the pure fincere gumme is so pierfing that no barrell can be made fo close, but that it will search the joynts, and draine through them, which opinion of mine although it may feeme ttrange, as nor being heard of before, yet I have many reasons both to induce me therunto. & some to contrary theirs that ob. ich the transportation of handfulsof Dictamusin Canes or Ferula stalks in the like manner, which are of far differing natures; the one a dryed herb, which needed not any fach inclosure to preferve the fent, whereof it hath not fo much that they needed fo to put it up for fear of loofing, and befids the cask was fo imal that abundance of them could containe but a little merchandize, some other cause they had surely, if they did put them, the leaves and stalkes I meane, into the Canes (whereof I fomewhat doubt, but that they put them rather with Canes to keep them from breaking) & this other a gum that required some tight cask to containe it, for feare of

leaking, and the Cane between the joynts, as not having any chinke, was the fittest with them I thinke to containe it, and thereof I thinke came the name of Calamita, to confirme which opinion, I have found the fincere gumme of Storax, which I have by Art and the presse onely (and not by any distillation) purified and made to be so pure that it would pierce even through a woodden vessell in the heate of Summer, and therefore was forced to keeps the faid fincere gumme in a glaffe or gally pot, which was fo fluent that it would runne upon any finall occasion the aning downe the vessell, a long time after the extracting. There is some doubt also with many, what our Signax liquida should be, for none of the ancients have made mention of any such thing: some would have it a Li de of Storax from the tree, and to that purpose Durante hath figured out a Storax tree, appropriating the Storax liquida, to iffue from thence, which is besides the text, and more then he can prove: others from the Arabians I thinke, take it to be the extraction of pure fat Myrthe, called Myrthe facts, which I cannot fee how it should be so, seeing the Storax liquids, is of so strong and piercing a sent that no Myrthe, from whence they fay it should be taken hath any the like : it is therefore affuredly some other thing, whereof as yet we have not attained the knowledge, Baubinus laftly in describing this Serrax folio Aceris, in his Prodromus entituleth it Serras liquids, which how much or little it forteth thereunto, I know not, the time hereafter may declare. The Secrax rubra something hath beene spoken thereof here before, yet some travailers have affirmed that the tree thereof groweth in Cyprus, but (unlesse they meane the first Storax tree) untill it be further confirmed, I shall rest doubtfull thereof.

The Vertnes.

There is no part of this tree in use with us, but the gumme that issueth out of it, and it is hot in the second degree, and dry in the first, it heateth, mollefyeth and digesteth, and is good for coughes, catarrhes, destillations of Theumes and hoarfeneffe: it provoketh womens couries, and mollefieth the hardneffe and contractions of the Mother, it gently loofeneth the belly, if a little of the true Turpintine be put unto it, and so made into pilles and taken: it refifteth those poysons that kill with colonesse, as the Hemlocke doth, and the like: a small quantity thereof taken faith Pliny, doth drive away fadnesse from the minde, but if it be taken too much or too often, it doth contrarily bring and encrease ir, and worketh paine and heavinesse in the braine, and, cause troublesome fleepes. Vied as a peffory it draweth downe mightily, both the couries and the afterbirth dropped into the cares, it taketh away the lingings and noyfe in them, applyed to the hippes, shoulders or joynta afflicted with cold aches it resolveth and comforteth much, and is good to be put into the bathing are made for lamenesse in the joynts, and wearinesseby travaile, it is also of good use to be put with white francumsence, to persume those that have catarrhes, theumes and defluxions from the head into the nofe, eyes or other parts, by casting it on quicke coales and holding their heades over the imoke, and to aire their night caps therewith, wherein they meane to lie: it Historych hard tumours in any part, as those about the throate called the Kings Evill, and other nodes or timours in the fieth or on the joynts: It serveth also as a perfume to burne in houses or chambers, either alone or with wher things, it is put also among sweete pouthers in bagges, for chells and wardrobes.

CHAP. XCI.

Draco arbor. The Dragon tree.

Must needes adde this tree to the rest of the berry bearing Resinous trees, because it agreeth with them, whose description is on this manner. It is a goodly faire great tree to behold, rising as high as a Pine tree, with a great body, covered with a rugged barke, full of chappes and clifts, bearing eight or nine great armes, equally spreading from the toppe of the truncke or body thereof, each of them bare, for a cubits length, and then thrulling forth at their heads three or foure smaller branches, yet of an armes thickenesse, and bare also for a certaine space, and bearing at the toppes of

each of them, divers very long and narrow leaves joyned together at the bottome, and compatting one another like as the Flowordeluces doe, each of them being a cubit in length, and an inch in breadth, growing narrow-er to the end, where it is pointed with a thicke middle rib, running through the middle, all the length of them. and being reddish about the edges, which are sharpe like the Iris leaves, abiding alwayes greene: from among the leaves at the heads, come forth long footestalkes, of about a footes length, branched forth into other leffer stalkes, bearing at certaine spaces, divers fruites or berryes in cluflers (for the flowers have not beene observed) each of them like unto a small Cherry, of a sowrish or tart use, and of a yellowish colour, when they are ripe with a stone within them, very like a Cherry stone, and a like kernell also (but here is no shew of any Dragon here in to be seene, as Monarday sableth, and others that from him have set it forth, which sheweth how necessary it nto have judicious and confcionable men to be the first idators of ftrange or unknowns things) out of this tree thing flir or bored, comment forth a thicke (not cleare as Matchieles faith) darke red gumme or Roffin, which bridneth quickely, and will melt at the fire, and flame being cast therein, yet somewhat dryly, being bruised it heweth a very orient red crimfon or bloody colour, yet avery hardly mixed with any liquour, eyther water or oyle : the wood is very hard and firme, and hardly admitteth to bee cut: but the younger branches are more tender. What if Master Hamonds siesh tree, growing in Magadascar, set forth in his Paradox, yeelding liquor like blood, may not prove to be this tree, if the tenderne fle of the wood, cutting as he faith like flesh either hinder nor the identity, or be not an hyperbole.

The Place and Time. This tree groweth in the Islands both of Madera, and the Canaries, and in Braffill alfo, as I am given to under-land, where it groweth valt, but Cluston faith that he found it in the Orchard, belonging to the Monastery of our Lady of grace in Spaine, planted among fome Ollive

mes on a small hill; the Time is not expressed. This is so tender, that although it hath sprung with us from the flones that were fet, yet it would scarse endure to the end of Summer, but perished with the first cold The Names

It is most probable that neither Dioscorides nor any of the ancient Greeke or Latine Authours had any knowledge of this tree, or could give any description thereof, but of the gum or Rossin onely, yet neither knew whether it came from herbe or tree, or was a minerall of the earth, but called it wrrallaen in Greeke, and thereafter Cimnabaris in Latine, Dioscorides faith that it was to searle to be had, that the Painters could not get sufficient for their workes, but yet faith fome called it Sanguli draconis, so ancient is the name, and by which onely the moderne Writers are led to thinke that the gumme of this tree continuing the mame to this day, the rest of this deduration agreeing like wife thereuno, is the right Clintaberis of Dissertion in the Pliny in his 33. Booke and 7. Chapter, for the elder world hath fabled (no less then Monardus from his Bishop of Carthage in this as is aforeid) and fee it downe for a truth that Cissalerie, is no other thing but the blood of a Dragon of Serpent cruffer beach by the weight of the dying Elephant killed by him, and that both their bloods mingled togethers, was the Sangan drawed that the Painters nied, and was also nied in medicines. Inlied Solians also affirmed the fame thing : but affiredly the true cause of the name bereof was the bloody colour that the geim gave, however they coloured the renth from others knowledge by the name of a Dragon. the Verrall

There is no part of this tree put to any use in Physicke with any that I know, but the gum onely, yet no doubt

Drace arbor. The Dragon tree.

1532 CHAP.92.

in the natural places, or where it groweth, both barke and fruite might be applyed for fust like disastras the gumme is put unto, which is very all ringent, serving to restraine the fluxe of blood or humans, from any parts, both in man and woman, as laskes, the menstrues whires, and the gonorrhea: it is allo said to be the straining and stoppings of the urine, to fasten loose teeth, and is very available for the gummes are specify or with soose flesh: it is good also to stay the watering of the eyes, and to helpe those places that are burnt with fire: The Goldsmiths and Glasses use it much in their workes, the one for an enamell, and to fet a foile under their pretious stones, for their greater luster; and the other by sire to strike a crimson colour into glasse, for Windowes or the like. I doe not know that Painters can bring it to be a fit colour to be used in their workes.

CHAP. XCII.

Cedrus magna Conifera Libani. The great Cedar of Libanus.

Herest of the Arbores resinistere, those trees that beare Rossins are to follow, which are these that beare Cones, being the great Cedar, the Pine tree, and all the sorts thereof both tame and wild, the Pitch tree, the Firre tree, the Larch tree, the Cypresse, and the Arbor vice, or tree of life: and sirst of the great Cedar. This great Cedar groweth up with a great thicke upright body, taller then any other tree whatsoever stored with branches on all sides, but so or tree that the lower branches

any other tree whatfoever stored with branches on all sides, but so ordered that the lower branches spread largest, and still upward they grow smaller up to the toppe, representing the forme of a Pyramid or Sugar loase, to them that view it a farre of; the greater and lowest branches with the body are somewhat rugged

and full of chappes, but that of the upper branches is very smooth, and of an ash colour, and being rubbed away with ones nailes, appeare h greene underneath, and reddish under that: the branches fou e fay grow all upright, but others straight out, and as it were crosse wise, stro g, but brittle, and easie to be broken, not to be bended and so placed about the body, one above another that they yeeld an easie ascent up to the toppe, as it were by steps: the leaves grow many together, out of a knot, which are small long and narrow, like unto those of the Larch tree, somewhat hard, but not sharpe at cleend as they are, and so fer, the longest being in the middle, and the lesser on the sides, that they represent the forme of a Painters penfell, abiding alwayes greene on the trees, being somewhat sweete in sent, a little sowre, bitter and astringent in taste: it beareth Cones that grow upright like as the Firre doth, not hanging down; as others doe, flenderer then those of the Pitch tree, and thicker, greater, and harder then those of the Firre, somewhat yellowish and round at the end, made of many scales, with a short soote-Stalke to it, but so firmely fet to the branch, that without breaking away tome of the wood of the branch, it cannot be pulled away, yet the scales opening of themseives, will fall away, leaving the ft lke bare that went through the middle of them, but this it will not doe untill the next yeare after it be ripe, for it requireth one whole yeare to ripen, within which is the feede, as bigge as Grape kernells, somewhat sweete in taste, bedewed with an oylie substance, that is of a good fent: out of this tree there commeth two fort of Rossia called Cedria, the one thinne like unto that of the Firre tree, which commeth forthby piercing the tree at the fundry knots while they be young and not covered with a rugged barke, and putting thereto an horne, out of which it must runne : the other Rossin floweth forth of it owne accord, growing hard of it selfe thereon, which will sticke so fast to the teeth if it be chawed, that it will hardly be pulled away againe, and being smel'ed unto giveth a very sweete sent; the Wood is durable above all other, and not in many ages yeelding to cor-The Place and Time.

Celrus magna Cones Libert.

I he great Cedar of Libanus.

This Cedar groweth on fundry mountaines in Syria, and the parts neare theremato, and the coldest parts of them that are covered with snow as Amanus, Taurm and Libanus, and not in many places else that have beene observed, the time is declared in the description to be a whole years in perfecting the fruite, and as Pliny saith, new come forth before the old are ripe.

The Names.

This Cedar is called in Greeke 18 35 (not known to Discording Galon on Pluy, as their workes tellife, for theirs is the Daycedrus, that beareth berries like to Iuniper, or the Mirtle) and the phant quest changes in the growth high, like the Firre, Theophrafius calleth it 18 90 counts Goding Plantes, which Garagonstily traditates Punica, and in the Gosponickes Dendrolibanus, Cedria you have being before what it is, namely Rollin that flow Punica, and in the Gosponickes Dendrolibanus, Cedria you have been before what it is, namely Rollin that flow Punica, and in the Gosponickes Dendrolibanus, Cedria you have been deferred and the Codring, which some calleth out of the tree, when it is bored or peirced, as in the Firre inductor trees:

Welsom of Codroslosm is the first liquid substance that comments out of the stickes, while they are in the birming such as we call thing, that is, the liquour of the Pine and like tree stickes when they burne), before the hand such comments forth, with which as well as with the Codrie, in former times the Printing embalased the basis of the dead, to cause them to shide for ever uncorrupted; but many Writers contained thick and the Pacific Codre, that issue the burning after the first, calling them (advis, when as they are divergent to the tree Serbin, (and the Rossin or Tarte Kitran Alkieran; and Rossian Codre, the Serbin Codre, and we Cedar.

The Vortue:

There is no part of this tree put to any Physicall use, but the Cedria, or Rossin that comment out of it which is brinthe fourth degree; and preserveth the dead bodies from rotting, and therefore was called the life of the said and the death of the living, because if it be laid on garanents or skins, it will burne and consume them; was also the tender flesh of the living, it will worke like a causticke; yet is it effectively to cleare the sight from site vinegar and dropped into the eares, it killeth the worses, and with the decoction of Plyssope, being put inteeth away the noyse and humming in them, if a little of it be put into an hollow tooth it easeth the paines, albreaketh the tooth, if it be mixed with a little vinegar, and they washed therewith it will doe the like; it in the little of the best of the throate called the Quinsie, and killeth both airs and lice; it resistent the poyson of the sallare taken in sodden Wine, and if it be laid with salt on the biting of the venemous serpent called Cramers of the lungs, and heaterthe leprose also, if the either annointed or taken inwardly, and purgeth the ulbrass called the them if a small quantity thereof be taken: it also helpeth the itch and scabs in many upon if the privy parts be touched therewith.

CHAP. XCIII.

Larix. The Larch tree.

He Larch tree groweth oftentimes as high as either the Pine or Firre tree, but most usually lower, covered with a very thicke barke, sugged and sull of chappes, and reddish on the inside, the branches grow one above another, in a comely order, having divers small yellowish knobs or bunches set at several distances, from whence doe yearely shoote forth many small thicke long and narrow, soft and smooth meeters, as it were in a tust together, like the former Cedar, but shorter, smaller and blunter pointed then be knobs or either Pine or Firre tree, which doe not abide any Winter as they doe, but fall away as other trees as should be shown that the shorter shown that the shorter should be shown that the shorter should b

rix, which he don't to Picea, as Lugdunensis sheweth very amply. Uitravim also erred with Pliny, in saying that the wood of the Larch tree did burne no otherwise then a stone in the fire: that Fuchsim also was in an errour Matthiolus sheweth, that though the Venice Turpintine was taken from the Fire tree, for he protesteth that upon his owne knowledge and sight, it came from the Larch tree, he also insisted against Brajavalus, that thought other trees had produced Agaricke: but those of other trees were hard Mushromes, such as we call Touchwood, which serveth like tinder to receive fire strucke from the sint, &c. all Authours call it in Latine Larix, the Italians and Spaniards: Larice, the French Meles, the Germanes Lerchenbaum, and we the Larch tree.

The Vertues.

I have spoken so sufficiently of both Turpintine and Agaricke, in the second Classis of this Worke, that I can adde nothing more thereto, and therefore to prevent a double repetition of the same things, I must referre you thereunto.

CMAP. XCIIII.

Pinsus. The Pine tree.

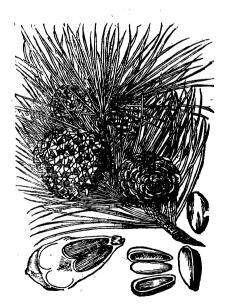

Here are many forts of Pines, some tame some wild: of the tame kinde there is observed little variety; but of the wild much, for some grow on mountaines farre distant from the Sea, others on the hills and places neere the sea, of all which, although they be many, I would make out one Chapter, and not separate them into any more.

1. Pinus urbana sive domestica. The manured Pine tree.

The tame Pine tree groweth very great and high, with a thickereddifh coloured barke, spreading large armos towards the toppe, and they againe divided into other lesser, whereon are set by couples together at a joynt or knot all along the branches, close one unto another, long narrow or almost round, hard and sharpe pointed, pale greene leaves, abiding continually on the young branches, and not falling away but from the elder: this beareth certaine small yellow catkins in the Winter, which fall away in the Spring as the cones encrease: the fruice or cones, that are somewhat long and round, grow very high on the branches, and are somewhat greater then in any of the other forts, composed of fundry hard and browne wooddy scales, lying close one unto and upon another, which when they open of themselves, or are caused by the heate of the fire, doe shew within them certaine hard shels, which contains in each of them, a long and whit every sweete kernell, covered with a very thin reddish ikinue, that is easily tubbed of; the wood hereof is firmer, heavier and closer grained then of the Firre or Deale, reddish also, and not so short or brittle as it is, and with a kinde of mosture about the heart. This is not so plentifull in yeelding either Rossin or Pitch, if it should be so ordered as the wilde kindes.

1. Pinus urbana five domestics.
The manuted Pine tree.

Of this kinde some make another sort, whose cone or apple is somewhat longer.

2. Pinus sylvestric montana fruttifera. The fruitefull wilde Pine tree;

This wild Pine groweth feldome to high, but very like unto the former rame kinde, being no otherwise to be distinguished from it, but that it groweth of it owns accord upon hills and mountaines, and that the barke thereof is thicker and rounder, and the leaves somewhat shorter, harder, more prickly, and of a sadder greene colour, and the cones or fruite smaller, but have as good and sweete a kernell within them as the former, and contained in as hard a shell.

3. Pinus sylvestrie altera fruttifera Teda arbor forte. The fost sheld wild Pine tree.

This other wild Pine groweth great in fize, and large in body, but yet not of that heighth as the other, neither is the barke reddith nor to thicke, but darker and pliable: the leaves allo are like, but grow thicker on the branches, even foure or five at a knot or joynt, and the tree fuller of branches, but more crooked and full of fappe, and end in a penfill-like forme: the cones are small and thore, not much bigger then those of the Pitch tree, of a darke purplish colour, full of Rossis, but softer, and the fiels within them easie to be broken betweene ones singure, the kernells likewise being very tender and short, and sweete, like near those of the same Pine, but a little barther, as the taste of most wilde straites are, in comparison of the manured. This kinds doth more frequently corner with the abundance of the sappe, which is the Rossin, then almost the force.

4. Pinus fylus frushumilu infruttifera. The low wild bareen pine use.

This wilde Pine tree rifethup with little or no body at all, but shooteth forth very long arases found about like unto pipes, from whence peradventure it was named Tubulus being ten, and sometimes fifteene cubits long, whereof some call it also repost, being stender and without knots, or branches, of which are made hoopes to hade caskes, because they are so smooth and so slexible: the cones are not bigger then she last, but have no kernels within them that may be eaten, and therefore called infrustifera, barren or fruitesse, and not because it beautiful or copies or fruite.

g. Pinm spluestrin sterilia elatior. The taller barren wilde Pine tree.

This tree hath a single blackish roote, that shooteth downe into the ground like a staller, the body whereof is often trooked and writhen, covered with a reddish barke, but the branches are smooth, and easie to be broken, being thicke bushing at the toppe, the leaves are slender and hard, and but two at a knot or joyne, somewhat writhed at their first springing, and tasting harsh and somewhat sower: the conse are but small and without any dible kernells like as the last is.

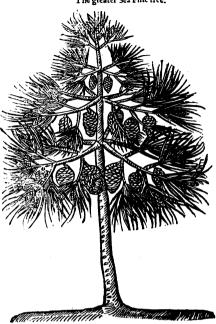

6. Finus maritima major fruitifera. The greater Sea Pine tree.

This greater Sea Pine rifeth to a meane height, with a crooked body, and for the most part spreading into branches from the ground, the leaves are somewhat long, and like the first wilde kinde, but shorter and greener, the cones are somewhat lesser, longer, and whiter, with much Rossin often on them, the kernels whereof are like unto them, but covered with a blacke skin. Clusius hath set forth another fort hereof, whose significant like unto the server of the server

7. Pinus

6. Pinna maritima major frudifera. The greater Sea Pine tree.

1536 CHAP-94.

r. Pinaster marītimus minor. The leffer or dwarfe Sea Pine tree.

6. Piera maritima mater fructifera chera Ciulit. Another fort of the greater Sea Pinetree of Clufin.

TRIBE16

8. Pinafter pumiles montanus. The dwarfe mountaine Pine tree.

7. Pinus maritima minor. The leffer or dwarfe Sea Pine tree.

The leffer Sea Pine scarseriseth to the height of a man, full of more slender and pliant branches then the former, not covered with fo rugged a barke, nor spreading so much, the leaves are very slender, shorter and not so hard: the Cones are likewife leffer and flenderer, and fo are the kernels alfo, and covered with a blacke

8. Pinaster pumilio montanus. The dwarfe mountaine Pine tree.

This dwarfe Pine riteth to a mans height, branching forth from the ground into somewhat large armes, and covered with a thicke rugged barke; spreading about: the leaves stand by couples, as in divers of the other forts but thicker fhorter and blunter pointed, and of a fadder greene then in the first wild kinde, the cones are small light above an inch long, not much bigger then the Larch tree cones, but more round at the head, and smaller at the end, flanding upright, and not hanging downe as all the others, the fhell of the nut within is winged as many are but the kernell is finall and hard.

9. Pinaster tennisolius julo purpurascente. The crooked mountaine Pine with thin leaves. The body and branches hereof are crooked or writhed and not fireight, the leaves thereon are very things, and horter then many others two joyned together round about the branches at the ends whereof come forth certains fmall fealy catking of a purplish colour which fall away into a fmall pouther, and after them come in the middle anew sprout of leaves, inclosed in a certaine skin : the cones hereof are small and blunt pointed. 10. Pinaster ninger latiore folio julis palle (centibus. The crooked mountaine Pine with broader leaves!

This other crooked Pine hath such a like body and branches as the last, spreading much, and with a sadder barke, the leaves are broader also, sharper pointed and shorter then they, and of a darker greene colour a the catkins comming forth at the ends of the branches like the last, are of a yellowish greene colour, and not pure ple as they are after which come new leaves in the like manner ! the tones are fmaller then they?

The Place and Time. The first tame kinde is found planted in fundry places of divers Countries, for the beauty of the tree with his ever greene leaves, yet are they found also wild about Ravenna towards the Sea fide. The other forts grow both in Spaine, Italy, and Germany, and the parts neere adjoyning, and the Sea kindes neere the Sea, in many places, and upon the Land also as Cingus hath observed: the catkins of many come forth in the Winter, and fall away in the Spring: others foring not untill May, the fruite of some of them being ripe in the end of Autumne and others, not of a yeare after the springing.

The Name,

The Pine tree is called in Greeke moun, in Latine Pinui, the Cones are called zone, in Latine Coni, and the uncienter Greekes gisino, but now the kernels are fo called the kernels within them antities, Picyides, 48 Dioforides faith, who calleth both those of the Pine and of the Pitch tree by that name, whereof Matthiolia is in fome-doubt that the place is erronius, the word Pitch tree being thrust into the Text without any ground of reaion: for muldes are the nimer tesmer, as collino be the muyor Pinorum fruttus; and the kernells onely of the Pine me are edible, and not the Pitch tree. That mevin which Theophrastus, Dioscorides, and Galen theweth, should bethe Pine tree, and not the Pitch tree, may be shewed in divers places out of Galen and others, although Pling doth mistake them, from the like nesse of Pence to Picea, and Pisys to Pinus, as also Pence to Laria; and Bellonu from him doth to also, and Gaza sometimes translateth them right, and sometimes wrong, but there may be smuch doubt, what tree Diofeorides, and Theophraftus meant by wires, whether the Pitch as it is thought by the most judicious or some fort of Pine, because Dioscovides putteth them both together in the title of the Chapter, as if they were both of one kinde, and yet sith some held them to be diversible, and mattern the fruite of them both by one name as is shewed here before, when as it is plainely knowne to all that have observed them. that the Pitch tree doth more recemble the Firre then the Pine, as being no other difference Betweehe them, the Pitch and the Firre, then betweene male and female as I shall show you after a while, and there is greater difference betweene the Pitch and the Pine tree, then there is of the Pines among themselves a sind the pine tree, then there is of the Pines among themselves a sind the pine tree is of the Pines among themselves a sind the pine and a wild, which is not found in him to be so distinguished, as he doth of the Pines a likewish sind the si munif the wond in him to be to diffinguithed, as he doth or the right? I mow to mend this matter, that Linguithed much the reading of wine a peut to be understood pice, a suit politim, two words in him fidered by the but the continued the suit of the continued the suit of the continued the suit of the sui the that hould notify it, and then ferveth for lights as Torches, flived out into thivers the Taulity Perof Theoporalist fliewest 166,6 can jamps 15. as he did 166,3 hift. 10. what Teda is, but other good Authoria shew that although Tada. It for the light the theoporalist and others, yet that letteth not, but that there might be also a tree peculiar ting to be the reason of the properties of the properties. It being homonomia, a word of divers significations, and that else Pliny was not in the light sealing properties. It being homonomia, a word of divers significations, and that else Pliny was not in the light sealing properties of the Bookes. The first here set downe is called Pinus flives from fitting, attiva, and only at signify properties from the written thereof. The second is called Pinus flives for first first which will be propertied to the properties of Matthiology, and the properties of the computation, and his Pinus flives in the Pinus flives in the Pinus flives in the Pinus flives the Pinus flives for the first in the Pinus flives for the first in the Pinus flives for the first and properties of Lugdanensis. The stiff is the Pinus flives for the first are the next or fix that is Times properties and the other of this kinde, is another sort there of this kinde, is another sort the results when the the forth. The seventies the Pinus marisima miner of Dodoneus, and Baubinus, and the third Hipanicus of Clustus. The eighth is Class his Finaster pumiminor of Dodoness, and Banbinsus, and the third Hispanican of Clusius. The eighth is Classes, his Finaster pumilio. The ninth his Pinaster errisus Andriacus. And the last is his Pinaster secondus Andriacus. The
drabians call the Pine Senabar, the Process and Spaniards Pino, the Franck Pini, and the kernells Pigeoso, the
Grammes Hartzbaum, and Fichtembaum, and Pynboltz, the Dutch Pinaspelbeom, and Weethe Pinettree, or Pine Apple tree.

Te.124 16.

The backs of the Pine tree is hinding and drying laying the lasks and provoking primes, is belieth the firstings and gallings of the skips, pickers also that possels the upper parts, and burnings with fire, caken with Coordan Myrighton or with Lithours, and aking them after, and mixed with Coordan, it shapes the firsting or one-ping of ulcers, the fumes thereof taken inderneath counters a delivery of the birth, and expelleth the secondine: ping of ulcers, the fumes thereof taken underneathers and activery of the birth, and expelleth the secondine; the leaves are cooling and asswage inflammations, and keepe ulcers from being inflamed, a dramme of them taken in water or metch, that is honged waters, are good, for the heate of the liver; i. if, they he bouled in vine-gar, and gargled waters in the month, it helps in the paines, in the teeth and gammes, the like doth the shivers of the Torchpine boyled in vinegar and gargled. The kernells of the Appleaure wholesome, and much nonthines while they are itseld, and although they be to be the kernells of the Appleaure wholesome, and much nonthines while they are itseld, and although they be to the water before the palines, yet they doe not offend, affectably if they be liceped inter to four librare in waters her of the palines to four of the parties, and on the palines are cold suith hongs, and to the doe that are of hot could intitutions may take them with Sagar, but those that are cold suith hongs, and the does not collect and only they doe amend the putrefying humours in the stomacks and bowels, and stir up bodily last and encrease sperme, if they be made into an electuarly with a large pourter of parties, and one is water, which they are hoard into an electuarly with a large pourter of a said passage. In the property is last, and expectorate fregme, and are good for an old cough, and the ulcers of the lungs that also lendin the uritory passages being freited with the store, and are good for the perfectors in the flores, and are good for made leaves to be arrent them and make them grow far, being often taken they believe the with the store, and are good for the members, to be arrent them and make them grow far, being often taken they believe the palie; shaking, and summelle of the members. Both Committakers, and Cookes know bow to make dainty Quie choics for their delight that will have them. There is a water destilled from the greene comes or applied that is very effectual to take away the wring kies

rwell excercifed there is, for it is to be differend but by some especial notes. It riseth up as high and groweth agrees at the Fire, steeple fashion, with a third tripid she absorbance between the branches a crosse as that doth, but he doing downes, not stading, upright as the fure, and greatest the branches a crosse as that doth, but he doing downes, not stading, upright as the fure doch. The issue also are thicke for oh all sides of the branches, and according to the time, being blindle and sheets and so the same leave are, so force, all of and not hat as the first leave are, force, all of and not hat as the first leave are, force, all of any on him, going of at the tree, unastly the stades opening, the seed within them which it is substituted that the first spraight forth, and being sailing for the trees, unastly the stades opening, the seed within them which it is small and black it, salieth our push the ground, the wood is sind other, softer, less known, and with fairer and singular graines, and, thereby, most account of the wood is sind other, softer, less known, and with fairer and lines substitute, said in worker their stade of the owner and the state of it owners according to the stade of the

It is called in Greake wires, and in Latine Pissa: because the pitch is made of this tree yet, as all Authours doe agree, the Ping tree is most usually taken for that gurpose, and of it is made both the best and the most bone. Indiana as Classica things the which Pine tree for it; in his Obone Indiana, and the winde Pine tree for it; in his Obone Indiana, which is the winde Pine tree, and of it is made both the best and the most beginning the winde Pine tree, which is the winde Pine tree as he faith, but Fallowise in his fifth Booke and 4.4. Chapter, doth there give, the fagure of the Sapinan; which is faith some French again call of Sapina, and some 4.4. Sapina, which is Lie deviced by the faith in the same by which is the Richtrie, so the faith in the lating of the Richtrie, so the faith in the lating of the Richtrie, so the faith in the lating of the winde pine tree, but if faith they make pitch, and Google faith faith of the property of the winde pine tree, but if faith whe not made of this tree it had the mame of pitch tree given in wants I was some pitch the pine tree, but I ragin faith, they call the Pine free it will be the faith when the pine free it will be the same of pitch tree given in wants I may supply and the faith of the pine faith, they call the Pine free by that mane also, the Passas, the Spanish all it Ask, but I ragin faith, they call the Pine free by that mane also, the Passas and Passas and the Tragon calleth Abiss refers, and chinketh iten be Passas the Dated Passas and Passas and all the Passas and passas and we Pitch tree. The Names. the Dutch Peckhoomia and we Pitch trees

The Vertues. The properties hereof are wholly attributed to be the fame with the Pine t ce, as is before faid, both for the barke and the leaves, but this not having any kernels, that are fit either to be eaten or uled in physicke, we can fay nothing of themi.

CHAP. XCVI.

Abies. The Firre tree.

Abiei. The Firre tree.

The plant of firming and Bodoneiii from him, doe follow Theophralisis and make, two forms of Firres, is considered in our days a which if it be as Clopius and others feeme to yeeld into, I triavelile their what tree his what tree his what the his which whether the first one of the wood, thigh it are colour, and with more or left which the first his thin is others, which either the his hy the morth of the by the morth of the lifter of handy grounds whether the tree branch of knot, and covered with a rough hard brittle gray backer, the greater arms than always four colour ther, one opported the or the younger than the property of the property

1540

ripe, but alwayes stand upright, and yeeld much Rossin in the Summer, but being wounded yeeld a yellowish cleare Turpul-tine, which is sharper then that of the Larch tree, and strongly for outward medicines: the wood hereof is foft and imooth, with many fouldes, and the knots are the hardest in any Tim-

The Place and Time.

This tree groweth in all the Countries of Germany, Polonia. Denmarke and Muscovia, and in divers other Countries also in Italy, Greece, Ge, in Scotland alfo, as I have beene affured, but not in Ireland or England, that I can heare of, faving where they are planted, and whether there were ever any growing naturally in England at any time heretofore is almost out of question:
The time is declared before.

The Names. It is called in Greeke inam, and in Latine Abies, and to called by aff Writers Without variation, but that Cinfum and some others make ir to be the Abies famina of Theophrasius, as they would make the Pitch tree his mas, yet as I said Bellonim and Dofonaus doe shew us another tree to be his mas, which yet is so like the Pitch tree, that if it be not it, we know not what to make it. Banhinss also consenteth unto them, and yet he calleth the mas, furfum fectantibus conis, when as their figure sheweth them to be dependentobus. The Italians call it Abete, the Spaniard's Abeto arbol, the French Avet, Sap, and Sapin also in fundry provinces thereof, yet Pliny (aith the lower part of the Firre is called Sepinal, and the knotty upper part Fufferna, the Germanes as I faid Thannenbaum and weife thannenbaum, the Dutch Dennemboom. and we in English Mast tree. Deale tree, but most generally Fire

The Vertues. Thebarke and dry Roffin of the Firre tree, is in property very like unto the properties of the Pine tree, but that this is more tharpe and more clenting. The cleare Turpintine or liquid Roffin of the Firre, is hot and dry in the second degree, and very clenting withall, wet as I faid not to fit for any inward as out-

ward medicines, being fomewhat too hot sharpe and nausious to many, and especially seeing we have two other fores of Turpinche fitter for inward griefes, it is of excellent use in all salves and Ballames that are for the head, or any other greene wound or old ulcer, clenting very much the old fifthy loges, and helping to heale them after, and fodering up the libs of the fresh.

CHAP. CXVII.

De Refixis. Of Roffins.

😂 Aving now she wed you all the trees that beare gummes or Rossins, I thinke it not amisse to entreste a little more largely of the Rossins, and Gummes themselves apart, both to shew you the severall orts of them, and the severall manners of drawing them forth, which I could not either well des before, or were omitted to speake of them here, and have their names muster all in one place, but because Gummes and K offins would be too much to handle in one Chapter . I will onely make

the Roffins my taske in this Chapter, and the Gummes in the next, and touthat Roffin is of two forts dry and moift, I will speake of them in each Section, but of the dry ones in the first place, and of the moift

Roffin is an oilinous substance dissolving and melting of it selfe by the heare of the fire, and apt to burne with a Konin is an olimous unitance annowing and meiting of it telte by the nearce of the min, and apt to warne with a flame, and called profes in Greeke, and Refina in Latine, the dry Roffin is called enter the Refina arial, and partin to the first friend, by led Roffin, that is, luch as from the Turpintine or liquid Roffin is boyled with water in great kettles or cauldrons, into our ordinary yellow hard Roffin on space Roffin, which is usually now address called Colobbonys; yet fome faythat. Colobbonys is the foote of the Turpintine, after the cyle is defitted from it, and profess or Refine liquid Roffin which is Turpintine.

1. Refine Cedia: The Cedia Roffins to

There comment out of the great Gedar brace and y. R. (fin of it owns a stoods, hardning upon the tree, which being chewed flicketh to fail to the teeth that it can hardly be pulled from it;

There is another all odds whe from it that is liquid, and both of them railed Coding, but this liquid especially, for that there is more flore of it gathered, and not note the also and is designed from the tree by boring it at the young knots before the barket be sugged, and ferting an hollow horne to the hole; that is may runne out thereat into vessels fet under the receive it, and is of as sugged, and ferting an hollow horne to the hole; that is may runne out thereat into vessels fet under the receive it, and is of as sugged, as the strawberry such the sweet and not a Discoving faith of a gricy one sent, for Marchiele, out of a very sundent summering the meadent the worst to be of a strong fent, or throng sweet sent as fright his week dock in the worst to be of a wery sundent called Cod strawby. Flan, and where which may be understood of the wood also, but there is a cattaine liquous called Cod strawby. Flan, and where which

which is like our Tarre, and taken in the same manner from it, for they of Syria make Pitch of this Cedar, as affoof the Oxycedrus the prickely Cedar, as we in Europe do of the Pine and Teda, that is, cut into flickes to burne his liquour commeth first from it in the burning, which is of that force and efficacy, that in Egips they did beforeare the dead bodies there with fundry times, which preferved them perpetually from putrefaction, for being of a caudicke quality, it did feede upon, and confume the moillure in the carkale, and fo kept it from puttefying, but divers have confounded both the Cedriss and the Cedrissm together, and the pitch likewise calling them momileuoully, some while Cedria, or Oleum Cedrinum, which is Cedreleon ex malis Cedri, saith Pliny, and at other inces Cedrium, when as properly Cedria is the Lachrymacrada Cedri, or refina Cedri, and the Cedriumi, the Pix banida Cedri, and thepitch it felte is Pix Cedrina, yet both the Cedria, and the Cedrium are of one operation : They in Syria, by Pliny his words in making pitch hereof, and of the Turpintine tree did use a kinde of furnace, wherein they piled their flickes, and made a fire round about the furnace, but put no fire within it, as we in Exmedoc, in making pitch, as I shall shew you hereafter, when I come to speake of the pine and pitch trees, Bellomin faith that of any of the Resinous trees as well as of the Cedar is made Cedria, which both Matthiolis and Lugdistantis doe worthily reprehend for so manifest an errour: The Vertues and properties whereof are set downe before, and neede not a repetition here againe.

2. The Oxycedow or great prickly Cedar tree giveth a certaine dry Rossin or Gumme as it is called, somewhat like unto the Masticke, but that the graines are long, and of a more yellowish colour, but so dry if it be chewed betweene the teeth, that it will not be wrought into a paste like Masticke: but will be as a pourher in the mouth continually: this I take is called Gum Inniperi, in the Apothecaries shoppes, and Vernix also, and Sandarach likewise, because the tree is so like unto luniper, and Lugdunensis saith that both the gum of luniper, and of the Oxygedrus are called Vernix. Hereof is made a molt flinking larre, called by the French huile de Cade, when athey make pitch of the wood, as they do of the pine and pitch trees. This is most likely to be the iweet Cedar of

3. Refine Laricea, The Larch tree Roffins.

The Larchtree yeeldeth likewise two forts of Rossin, one breaking out at the chinkes of the barke on the body and elder boughes, which is cleere and white like unto white dryed Turpintine, and smelleth reasonable well, which will not be kept in drops, but will runne together into lumpes, untill in time it will grow dry and hard, kyeeldeth forth also a liquid Rossin, when the tree is bored to the heart as is before said, yeare after yeare, one orother, but not the same trees every yeare, one hole above another for eighth or tenne foote above the ground, which when they have fo done on one fide, they doe fo to another, fill clofing up the hole close with a pinne or wedge, this yeeldeth faith Pliny, lib. 16.c. 10. a liquour of the thicknesse of thinne hony, which never groweth hard, and againe in another place he faith, The Larch tree yeeldeth forth a thinne Rossin of the colour of hony, melling ftrong, not withftanding that he had faid that it burneth no more then a stone, nor yet maketh any coales. Viruvim alfo lib. 24. c. 6. faith the Larch tree yeeldeth a liquid Roffin of the colour of the hony of Attens, which is good for those that have a ptisicke: but in that they say it was of the colour of hony, you must not undefland the colour of our red hony, but fach as that Country of Athens gave, which was nothing to high colouted as ours, and which I do in part beleeve, led by divers reasons, to thinke, that that liquid Rossen which flowabout of the Firretree, being somewhat neare the colour of our hony was the Turpentine used formerly in the Apothecaries shops but as Matthiolm affurethus, the cleare white Turpentine that is in most use in the Apothecaries shoppes for inward medecines, and called Venice Turpentine (in imitation of the true Turpentine which commeth out of the Turpentine tree, as divers Liquours are called Ballames, in imitation of the true Ballame) is uken from the Larchtree, whose properties are declared before.

4. De Refina Pini, & Picea. Of the Rotfins, of the Pine tree, and of the Pirch. The Pine tree yeeldeth forth a kinde of fatty or gummy Rossin, that is of a whitish yellow colour, mideup with a great deale of droffe for the most part, and but little cleane Roffin in feverall parts to be seene in it, which doth quickely become dry, and to be made into pouther, smelling somewhat strong and sweete, and is our ordinary or common Francumsence that is usually burned in houses and chan bers, to aire and perfume them, called also Parrossin, and in shops Resina pins in France Garipot : this Rossin runneth out of the trees of it owne accord. and especially as Matthiolms and Lugdunensis say, out of the Cermolo or Teda, as being the sweetest, and falling upon the ground, is gathered from thence with what drosse it hath gathered into it in the spreading, and so put up with what lover slicketh to the barkes of the trees likewise, whereby it becommeth so soulce as we have it, and therefore had neede to be melted and strained before it be used, and then will grow hard and fit to be used, there is a kinde of dry Roffin alfo gathered from the nuts or apples called Refina Strobilina, which Galen maketh the chiefest and best of all other Rossins, although Dioscorides maketh it the last and worst. It yeeldeth no other bquid Roffin that I can learne : but from it and the forts thereof, before it turne into Teda as after but especially then, as having most store of pitchy matter in it, is made the best pitch and most store, and is made in Europe, where the trees grow, somewhat after the manner of making charcoales with us: For having prepared a place for the putpofe, paved in the middle, and raised up also a little, with a trench round about it, for the pitch to runne into, they pile up the Rickes and cloven wood, tetting them upright to a sufficient heighth and breadth, this pile or heape they cover with the branches of the tree, plashed close together, and very well limed or lomed on the outfide, quite all over, that no chinke be therein, for if any happen it must be presently stopped with lome, that no flame or fume passe our thereat, for feare of looking all, and onely one hole left below, where the fire is to be kindled, which also must bestopped up after the fire is well kindled, and that the liquour beginneth to runne into the trench, which must have severall gutters from it to be led from thence into others fit to receive the pitch asit runneth out : the Tarre and water with it runneth first out, which is kept together, and the pitch that commeth out after by it felfe, and then barrells are filled up with them feverally ; the thinner liquour is called Pix liquids in Latine, and whom works in Greeke, and when it is boyled againe and made harder whom England manufactured and Pix arida vel fices, and recotts, but the Piffs/pholeum is a bituminous or hard pitch, taken out of the earth, and was used to be melted with Tarre to temper it, and make it serviceable for ships. The Vertues whereof being not specified before, shall be shewed hereaster in the end of the Chapter. 5. Refins Pices. The pitch tree Roffin.

The pitch tree like wife thrusteth forth a whitish Rossin gathered betweene the barke and the tree, and breaking

TR 1 BE 16.

TRIBE 16

CHAP.97.

out into drops, fo like unto Thm or Olibanum, that many did counterfeit it therewith, as Galen faith lib. 2, decome med. fecund gener. c. 2. and lib. 3. c. 2. who calleth it minima planue Picee bulla, and this peradventure may be med. Jecuna gener. 0.2. and 110.3.1. 2. Will cancel it there Sphagas as Pliny faith, who also in another place faith hereof, that the pitch tree giveth a great deale of Rossin so like unto Thus, that being mingled together, they can scarse be discerned to be severall : this Rossin also is used to be mixed with the pine tree Rossin before spoken of, which is likely to be Galen his oversouten, and with them the Refina firobilina mixed all together : out of this tree likewise being wounded as in other trees for that purpose, is drawne forth a liquid Rossin, like unto that of the Firre tree, called by Plin Pix Brutia, as I take it, which is redder then the ordinary Roffin, and peradventure may be also the Colophony of the ancients, which was like Resima frilla, and brought from Colophony, but more tenacious, as betweene Rossin and pitch, which I take to be that which is usually called with us now adayes Burgony pitch, which while it is fresh is somewhat soft in working, and sharpe in tent, but afterward growing as dry as a dry Roffin, that will eafily be made into pouther. Of the wood and stickes hereof as of the pine. either together or separate is made picch, as is before shewed.

6. Refina Abiegna, The Firre tree Roffin or Turpintine. Some doe say that there is gathered from the Firre tree, a dry kinde of Rossin passing out thereof voluntarily as is before faid of the pine and pitch trees, and put altogether to make our common Francumsence, which how true or falle it is. I cannot either maintaine or disprove the knowledge of many such things, although of daily use is not easily attained, by them that dwell farre from the naturall places of their growing, From this Firre tree being bored to the heart, as is done in other the like, and some say out of the pitch tree as well, issueth forth in the younger trees a cleere yellowish Turpintine or thinne Rossin, but from the elder somewhat thicker, which being put into great cau'drons is boyled with a double quantity of water, but I thinke twice double will not ferve. fo long even two or three dayes continually night and day, untill it become fo throughly boyled and dryed, that it will not yeeld to a thrult, when it is cold, but will be hard and dry, and then is called yellow Roffin, and being molten a new is cast into great cakes, of an hundred weight a peece more or lesse, and according as the Turpintine is in clearenesse and goodnesse so will the Rossin be, and this is the grain of the Grecians, and Resize fritta of the Latines.

7. Resina Cupressina. The Rossin of the Cypresse tree.

There is some imes found on this tree, a certaine kinde of dry Rossin, but so little that we have little knowledge thereof, and leffe ute, Diofeorider and Pliny doe both make mention of a liquid Roffin, to be taken out of it as out of the Turpintine tree Larch tree and others.

8. From the Savine trees likewife of both forts, in the hot Countries is taken a dry Roslin.

9. From the Cedrus Lycia, the Cypretic like Cedars of both fores, is taken fuch like dry Rossias as from the Oxycedrus in small peeces falling to pouther in the chewing like unto it.

10. From the Arbor vite sometimes is taken a dry Rossin in small peeces and small quantity.

11. From the Arbor Thurifera is gathered the Thus or Olibanum, but what the tree is from whence it was teken we know not, nor they that have made mention of it, for fome fay one thing and fome another, so that I dare fay no more of it here, but in the next Classis.

12. Of the dry or liquid Rossins taken from the Lentiske or Masticke tree, from the Balfamum or Balmetree, from the Styrax or Storax tree, and from the Turpintine tree, I have spoken infliciently before, saving onely that I would give you further to understand that in Syria, and the parts neere thereunto they make pitch of the Turpintine in the same manner as they doe of the Cedar, besides the cleere true Turpintine that is drawne forth by pierfing the tree as in other Roffin bearing trees.

The Vertues of Rollin and Pitch. Rossin in generall as Galen saith, that is of all forts, is hot and dry, but they differ much one from another, in being more or lesse sharpe and hot, and of thin parts: the Strobolina, that is, the Rossin taken from the nuts of the pines is the hottest, and that from the Turpintine tree the most temperate, the dry white Rossin of the pitch tree is hot and dry, but yet is not fo-drying as the Strobolina, although more heating: that of the Fire tree is as a meane betweene them both, even as that Colopbony, which smelleth and is like Thus or Olibanum is temperate likewise, the moiltest of them all is that other fort of the Larch tree Rossin, which is the sharper, of the stronger sent, and more bitter taste: The buile de Cade or stinking Tarre, comming from the Oxycedrus or prickely Cedar when it is burned, healeth all scabbes and itch in man or beaft, and other deformityes in the skin, as the Lepry morphew and the like, and performeth in a manner whatfoever the Cedria it felfe can doe. The Vcnice Turpintine boyled to a dry Rossin, is farre better then any other ordinary boyled Rossin to stay the flux of Gonorrhea. The common Francumience, Parroffin, or Rossin of the pine tree besides the uses to burne and perfume a house as is before said, it serveth in salves as a principall ingredient, to heale and fill up with flesh hollow ulcers, and to warme and comfort any cold griefe or part of the body: The Rossin of the pitch tree, called Bargons pitch, in being sharper and more hot, is much used for searcloathes against cold aches, and all forts of paines and griefes proceeding of cold, and by reason of the sharpe and quicke sent, is the more piercing : The pirch it felfe is not and dry in the fecond degree, yet mollefyeth hard knots tumours and fwellings, it bringeth boiles and foresto supparation, and breaketh carbanckles, and blanes, difperseth and scattereth botches and emposthumes, draweth forth corruption in fores, and healeth them by cauling flesh to grow up in them, and is used in many falves, both oyntments and plaisters that serve to draw and to heale: The Tarre water that commeth first out and with the Tarre, doth kill any Tetter or Ringworme being used thereon, and likewise any itch, and healeth up scabbes or scalles in the head, the Tarre it selfe is hotter then the pitch, and is used faith Dioscovides, against poytons, as also is good for those that have the Tiffick or cough or rotten flegme stuffing the lungs, and for hosesneffe and tough flegme, that will not eafily be expectorated: being rubbed with falt on a place that is bitten by a Serpent helpeth it, and being mixed with as much waxe, it taketh away the ruggedneffs of the nailes, it helpeth the hardnesse of the mother, the rists in the fundament, the chape on the hands or feete, it stayeth also spreading ulcers, it breaketh or diffolyeth the kernels under the eares and throate, called the Kings evill, being made up into a pultis with Barley meale, and a boyes urine, and applyed warmer it is likewife dropped into the cares with a little oyle of Roles to cleanse the mattering of them: it stayeth erceping ulcers applyed with Brimstone

or the barke of the pine tree, or with branne : The blacking that is made of the pitch when it is burned, healeth watering eyes, and the fretting fores in the corners of them: and with it and ordinary Turpintine well mixed. is made the Printers Incke where with they print Bookes, but not our ordinary Incke now adayes, how foever it might be in use in Dioscorides his time. The Turpintine that commeth out of the Firre tree is sharper and hotter then that of the Larch tree, and more naufious to be taken inwardly as I faid before, and therefore more usually out into falves, and for outward remedies: The Rossin that is made thereof is neere unto the property of Pitch denling heating drawing, and mollefying as well, and drying more then pitch: the ponther of Roffin is almost seffectuall as Amber pouther in the running of the reines, experimented by fundry Chirurgions, who have used inflead of the best fort of dryed Turpintine, which is for the same purpose, either to try conclusions or to save charges : it is used with pitch in many salves, or without it for all the purposes whereumto pitch serveth for all oreene wounds to heale them, and for all old fores and ulcers to clenfe them, incarnate and heale them up afterwards: it may be used in fumes with Olibanum, Maslicke, and other things that are burned, and the head avred with their imokes to helpe to dry cold rheumes, catarthes, and diffillations from the head. The Roffin of the Cyprefic tree is heating and binding, and ferveth eff. Ctually for all the purpotes that is spoken before of the nurs or leaves, or what elle thereof is used . The Rossins of the small Cedars are neere the property of the prickely Cedar, although not to effectuall or violent, In the like manner whatfoever droppeth or runneth forth from the Sabine trees is tharpeand hot like the leaves, &c. of the tree : and for the Arbor vita, although there hath been fometimes a kinde of Rossin found sticking to the barke of the tree, yet it hath beene in so little quantity. that I have not learned what use any hath made of it. The other Rossins of the Balme tree. 1 urpintine, Lentiske and Storax trees are spoken of sufficiently in their proper Chapters, and need not a repetition he e againe, of the same things there delivered: The Vertues of the Thus or Olibanum, you shall have in the next Classis with the relation thereof.

CHAP. XCVIII.

De Gummin arborum & herbarum earundemque succis condensatio. Of the Gummes of trees, and herbes, and of the dryed juy ces of them.

He Rossins of all forts being declared in the former Chapter, there remaineth to speake of Gums issuing both our of Herbs and Trees, and the condensate juyces of plants, yet I must except our of this number and Chapter the gummes and dryed juyces, whose plants are not knowne to us, from whence they proceede, and that are brought of old or of later dayes, from the East or West Indies, which are of use in physicke, for I determine to handle them in the next Classis, with the forraigne drugges in the Apothecaryes shops. I have as you see here joyned the condensate

juyces unto the gummes, because to them that know not their manner and nature, they seeme to be gummes, one si well as another: and that I may shew you the difference betweene a gumme and a dryed juyce, and both of them from the Rossins before spoken of, thus they are: Gummes are of two sorts, one that is of a watery or earthy substance, and will dissolve in warme or cold water, wine, or the like, and not in or with oyle, nor melt of themselves, being set to the fire, and will burne without flaming, and such are the Gummes of many trees. Theother is ovlious or unctuous and in part refinous, in that it cleaveth to fall to any thing toucheth it, and that will not diffolve with cold water, wine, or vinegar, but onely with warmed wine or vinegar, and will also betterdiffolve of themselves being set to the fire, then the other gummes will, and will give a slame in the burning, yet nothing to much as the Rossins, which as I shewed before are wholly unctuous, melting with the neate offire, and burning with a flame like oyle and (iich like unctuous matter being fet on fire: Another difference of a Rossin from a Gumme is this, that all Rossins although Lquid (some sooner or later then others,) will be dryed tole made into pouther; the juyces have scarse any of them any unctuous matter in them, being onely composed of a watery and earthy substance, condensace together, which wholly dissolveth with water and burneth like earth: to begin therefore.

1. Gummi Arabicum. Gumme Arabecke. Is a certaine cleare white Gumme that is prought from the parts beyond the Seas, and is taken to be the Gumme that commerch out of the Acacia tree of Egipt by many good Authours, Bellonius also confirming it, who travailed through those parts, and observed it, and Alpiniu who lived a while in Egipt, yet some have taken it to be the gumme of plumme trees, or of other trees growing in those parts : It is of fundry formes and colours, for fome are in round hard dry preces, of the bigneffe of a Tennis ball, or bigger, or not halfe fo great or leffe, all of them ragged and not import on the outfide, but whitifh for the most part, which being broken is cleare pure, white and transparent, yet some more or lesse then others, and some are very small long peeces, and therefore called vermiculatum, and held for the best, being in substance like the other peeces of the same greater size, are reddish, yet cleare and transparent also, which some take to be the gumme of some other tree, because it is of such a difterent colour, but that is no fufficient reason to disprove it, for we see in divers others forts of gummes, that the feverall peeces doe not all hold one forme or colour, and yet are true: this diffolveth of it felfe in water and ferveth as a glew to fliffen binde, or fasten many things: the tree hereof shall bee declared the second Chapter after this, for the manner thereof, it distilleth or droppeth out of the tree in bigger or lesser peeces, as either nature lift to thrust it forth, or as it is helped by cutting the barke and giving it way to iffue forth, which sticking too, and not falling off or upon the ground, is for gathered and reserved. 2. Gummi Prunorum & Ceraforum. Plumme tree and Cherry tree Gumme.

The Gums of both these trees come forth in the same manner that is said of the former, being of severall cowars each of them, that of the Plumme tree for the molt part being whiter then the other, which is redder : yet both of them electe and more claiming then the former, and vary, some of the Plumme trees being reddish, and of the Cherry trees while. المعاقب المحطل بيلي

C WA P. 98. 3. Gammi Amygdalarum & Perficorum. Almond and Peach tree Grammes.

Both these trees likewise yeeld Gummes very like unto the Planme and Cherry tree, that it is somewhere hard to diffinguish them, but that they are fomewhat whiter and a little dryer. Thus having flewed you although Gummes of the Trees that are knowne to us, let me in the next place shew you the other forts of Gums, takes for the most part from the rootes of Herbesand plants.

4. Gum Tragacantha, Gum Tragacanth.

This Gumme as I have showed before in speaking of the plant called Goates thorne is taken from the rootes hereof as they grow, a pit being made round about the roote, which will in the greatest heate of Summer, being deepely wounded, thrust forth very slender small peeces, crooked or writhed, feldome greater then a tagges point, or ones fingers end, and most usually a great deale smaller; some very pure white, and others a little vellowish, and some more reddish, much of it gathering drosse, which sticketh task unto either barke or stones, or earth, or the like: the gumme it felfe is tweetish in taste, and quickely relenting in water into a gelly, like made starch, and glewing things together as firme as starch or glew, in small and thin materials. The properties hereof are declared with the plant.

5. Opopanax. The Gumme Opopanax. This gumme taken from Panax, the All heale of Hercules is a yellow gumme, very browne on the outlide and vellow within being broken, the best is pure or fincere, that is, not mixed with stickes or drosse, but cleane gum. and in small drops, yet sticking fast together, of a sowrish sent, and somewhat strong, and being dissolved with wine or vinegar, will make it looke yellow, even as the herbe it felfe, being broken will yeeld a yellow fap or juyce in our owne Land : from the rootes chiefly and not from the stalkes is this gumme taken, in the like manre as I flewed you of the gumme tragacanth by digging a hole round about the roote, and laying boordes or tyles or the like, round about and in the bottome to keepe the gumme cleane, from earth, stones, or any other thing that might foule it falling among it after the roote is cut in three or foure places, as fome doe, or making a hole or two therein as others doe, whereunto the gumme will be drawne, and from thence flow forth. In the Claffie of Vmbelliferous piants are the Vertues expressed whereunto I referre you. 6. Galbanum. The Gum Galbanum.

The great Ferula or Fennell giant of one fort, is the plant from whence this gumme is taken, and that not in ev. 17 Courtry for that onely which groweth in Syria, as Diofcorid: faith yeeldeth Galbanum, the rootes being wounded in the fame manner as is before faid of the Panax: the gumme smelleth strongest of any of the Fernand laceous gummes, and is if it be fincere a little yellowish, with white peeces amongs it, and divers parts of sickes or stalkes broken among it, and sometimes the seedes also, so clammy and tenacious that one can hardly touch it without cleaving to their finger, and diffolving onely with wine or vinegar.

7. Sagapenam. The Gum Sagapen.

As Syria bringeth forth the Fernia, from whence Galbanam is taken, fo is Media the nourfe plot, as Dioscori-

des faith, where the fame or another Ferula groweth, from whence the gumme Sagapenum or Serapinum is taken in the fame tranner that the former is, and doth not much differ from it, but that it is not fo clammy, or gummy, but dryer, and of a redder colour, and imelleth not halfe to ftrong or flinking as it doth: The Vermes both of Galbanum and Sagapenum, are amply fet forth under the title of Ferula.

8. Gum Ammoniacum,
This gumme likewise is taken from a Ferula as it is said, growing in Cyrene of Africa, so that you see the diversity of the chimate, although in one and the same plant produceth diversities of gums, differing both in forms and operation: this gumme is much whiter then any of the three last mentioned, pure and sincere without any flicke or stalke in it, and with many whiter peeces among it, and not smelling any thing so much as the Sagapenum doth, which also being dissolved, will be whiter then any of the former. The properties of this Gam is very like unto the two last of the Feruloms gums, and thereunto you may referre it.

9. Euphorbium. The gum of the barning corny plant.
This gum is taken from the thorny plant Euphorbium, as we have beene alwayes informed from others, and not from any kind of Fernlow plant, as Diofeorides faith, the forme of which plant, as it hathcome from beyond the Sea unto us, even a small plant, we have here before exhibited unto you, the gum is of a browne yellowish colour, and fomewhat whiter within, in almost as small graines and drops as Masticke, of a most violent burning hot viercing tent, piercing the nestrils if it be but a little stirred, but much more and all most intollerable to him that shall beate it, and more to them that shall take it inwardly, the properties hereof are declared with the defeription of the plant. 10. Sarcocolla. Sarcocoll.

This is a small reddish and whicish gum in very small peeces and pouther, little bigger then Poppy seed, somewhat bitter in taste, and ready to provoke casting, but of no sent almost at all, Dieseride, faith it is taken from a tree in Perfis, which neither he describeth, nor we have any further knowledge of, it clenseth and dryeth, it cloicth up greene wounds, and stayeth catarrhes, defluxions and rednesse in the eyes.

.II. Gum Hedere. Gum of Ivy. The gum that is gathered in the hot Countryes from the stems and greater branches of the Lvy tree is of a very darke red or browne colour, comming to us in small drops, cleaving fast together in lumpes, a little cleare, and of fomewhat a ftrong fent, but very sharpe and burning : it killeth mits and lice, and fome doe put it into a hollow tooth to helpe the ach, being mixed with things convenient for it: fome use this gumme with other things, and some alone, made up with a little hony and crummes of bread into a paste, and cast it into standing pooles and ponds of fifth to make them turne up their bellies and lye as dead above the water for a fmall time, that they may be taken, which will returne to their fenses againe.

12. Scammenium. Scammony I have made a long narration bereof in the fecond Classis of this Work, whereunto I must referre you, and onely shew you here that the generall vote of the Writers thereof, is that the juyce hereof is taken from the rootes of the plant, ordered in the fame manner that is shewed in gathering the gummes of Fanax and Fernia, &c. but I am halfe perswaded it is otherwise, and made in another manner, because it doth not condensate into graines or fmall precess as those aforesaid, but is made into a whole uniforme lumpe or masse, of a darke grayish colour. Smewhat light and not ponderous, a little (pongy alfo, or with fome holes in it, fomewhat cleare and not muddy or droffie, of a firange and firong tafte, almost procuring cafting, and giving a fiew of milke upon the moistening with the tongue, but not burming in the mouth or throate, for that is a figure of adultering: The qualities are exprefied at large in the place before named.

The Herbe Alos, or Sea Honseleeke, I have likewise largely entreated of in the said second Classis before, with the whole manner of drawing out and preparing the juyce, whereunto I must referre you to to fave a tautologie a repetition of the same things againe, which were too tedious.

14. Opium. Opium. This also with all that can belong thereunto, I have e. pressed in the Chapter of Poppy before, and cannot adde use it any thing, more then is there set downe with the Vertues and Cautions, in as ample manner as I can. 15. Elaterium, Elaterium,

After I had given you the description of the wild Cowcumber, in the second Classis before. I declared the masting of the Elaterium of two forty, both greene and white, as may be sufficiently gathered from what is there faid. and therefore I shall for beare to fay any more thereof in this place; referring you thereunto, where the properties are also expressed.

Palma. The Date tree.

Lthough there be divers kindes of trees that goe under the name of Palma in Latine, whereof Plinyin his time mentioned three score and one, and since his time many others not knowne to him, have been brought to light, yet there is but one kinde of Date tree properly so to be called without variety, how-sover the climate where they grow, seeme to make a diversity, of greatisesse or goodnesse one from mother in the fruite, such as the opprassing and Pliny reckon, and although againe, for want of a fitter English same, as the former Wrights have thought, they have beene called Date trees generally: yet I would it I could will that improper name, and rather call them Palmes for the distinction of them: I will therefore in this place give you one it the description of the true Date tree, and thereto adjoyne two other called Palmitor, which others described have used. there doe accounts low or wilde Date trees; when in truth they have little or no refemblance thereunto, faving a little in the tree and interesting of fuel other Palmes, as have come to our knowledge, in the next Classis.

The Date free usually groweth very great and tall, yet in some places nothing so high as in others; bare of branches unto the toppe, the barke whereof is not so well to be said scaly or rugged, as knaggy, having short larges, which are the ends of the middle ribbes of the leaves, sticking out round about the body, which give medic footing like steps, to climbe or get up into the toppes of the trees to gather the fruite-the leaves that grow at the toppe are very long and large, made as it were of divers parts, and foulded together double; the middle rib being thicke and almost wooddy, but spongy within, which doe alwayes abide greene, and hang downewards with their ends: the flowers are enclosed in a long skinny theath, hanging downe from the lower branches of laves and sometimes higher, which opening it selfe at the end into two parts, thew forth a number of white affron-like small flowers, hanging by small threds in great bunches together; after which come the fruite, upon the faid threddy footestalkes, greene at the first, and reddish when they are ripe, with a hard firme small long and round whitish flome with a furrow in the middle: fome forts are small, and some great, some of a soft sub-sance some firmer and harder. some whitish, some yellowish, or reddish, or blackish, some round like an Apple, others long with the roundnesse, some having the toppe soft, and some none at all, some so sweete and lushious that they will not keepe long, unlesse they be pressed into cakes to be kept, others will abide whole for a long time, and fit to be fent also into any farre Country; yet all of them having a small round hard crowne or cap at the bad, which with rubbing one against another falleth off: the stones within the fruite, notwithstanding that they are to follid and firme as a very ftone, and can hardly be broken with an hammer, yet having a finall hollow place in the middle of them, with fo fmall a kernell therein, that it would not be thought to spring thereby, yet being put whole into the ground hath shot forth long narrow hard leaves, and have abiden in a convenient warme place divers yeares, without any great progresse, so little it liketh so cold a climate.

2. Palma bismilis five Chameriphes vel Palmites.

The wilde or low Date tree called the Palmito tree.

The Palmite or low or wilde Date tree groweth in divers places of Enrope, not to be above a yard high in the locke or body, shooting out leaves from thence very like unto the former Date tree, but much lesser and shorter : this beareth a round head at the fide of the leaves, composed of many foulds of skinnes, which breaking open, hew forth a number of white flowers, standing upon small thready stalkes: this head being out off, before it o-Penit selse for flowers, is very delicate to eate like a Coleflower of Cabbage, and more pleasant then either Hartichoke, Chardon, or Tartoufii be, and are ferved to rich mens tables for a fallate of great delight.

3. Palma Chamarops Plini five Chamariphes spinosis faligs. The Thorny Palmiss.

This groweth in a manner wholly like the last, but the leaves being made as it were of many hard plaites have

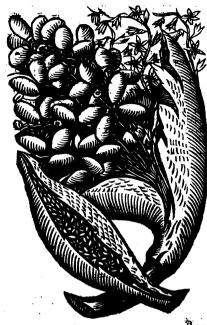

many thatpe and thort prickes or thornes, on the backe of them, and the stalkes of them likewise, whereby it differeth from the other, whether the heads and fruite be alike, I cannot certainely heare.

The Place and Time. The manured Date tree groweth in all the Bafterne Countries generally, Galen and Pliny, with others commen? ded those especially above others, that grew in Indea, and in the valley of Hierleber Bellowing faith, they deferved not commendations, meither were they ripe about Ierafaleth, above a moneth after they had beene gatheted in Egypo's they grow also in Italy where they are planted but beare no fruite, and in Spaine by she Sea fide. Qqqqqq.

Palma valgaris er tegttima.

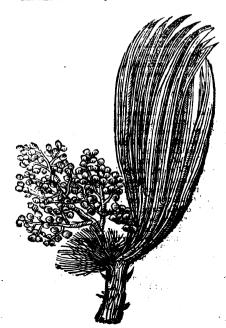

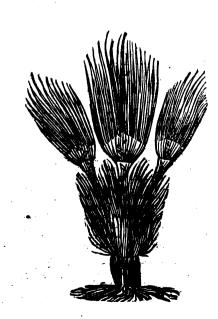

2. Pal na humilis five Chameriphes. The wild or low Palme, called the Pulmito tree.

3. Pala a Chamarops Plinij five Chamariphes feinofis foliis. The therny Palmito.

but the fruite is nothing fo good as in Cyprus and the Lovant. The other two forts grow, the first in Sicilia. Candy, ore. the other in Spaine: they flower in Aprill, and are ripe in November or later. The Names.

F The Date tree is called in Greeke Point Phanix, in Latine Palma, and the fruite Aduntors of prints Palmala and Dallyli; the fleath or skin which encloseth the flowers, is called E'ham Elsis, and arrive Spathe, and some thinks me kinde of Date is called Palma Elate: the best fort of Dates are called Carrote and Phonicobalante, which were also called regie, because they were fittest for the dyet of Kings, Thebanes were the leane dry Dates, that had little substance in them: the ancient Writers have set downe many things of Dates, that there is male and female, and that they both beare fruite, so that they be within the fight one of another, or else they will not beare, but I pray you account this among the rest of their fables. The second is called appropries by Theophrass and Chameriphes in Latine by Lobel, Lugduenfis, and Palma humilis also by Matthiolm, and Palmitee or Palmite by the vulgar in Isaty Spaine, &c. the Greekes also call that head that is used to be eaten in sugaror, the Isalians and Spaniards Cefaglioni, The other is called by Lugdanensis Chamerops Pling. The Arabians call the Date tree Machia, and Nachal, and the fruite Tamar, the Italians Palma the tree, and Dattoli the fruite, the Spaniards Palmeira, and Tamaras, and Dattiles the fruite, the French Palmier, and Daffier, and Palmes, and Dattes: the Germanes Dattelbaum, and Dattelz, the Dusch Dayeboom, and Dayer, and we in English Date tree, and Dates. The Vertnes.

The untipe Dates are very harsh and binding, and the ripe also while they are fresh more then when they are dry, flaying we here's courfes, vomittings, and the laske of the belly, and flay alfo the bleeding and failing downe of the fundament and piles; being taken in red wine: if they be used that are dry, they helpe the hoarsenesse and roughnesse of the throate, the sharpe cough by reason of sharpe them falling on the breast and lungs, the decoction of them taken, alayeth the force of hot agues, and stayeth spittings of blood, the paines in the stomacke and bowels, because of a flux, and boyled in old bydromel, that is, mede or honyed water, and taken doth refresh the spirits: used likewise in brothes or meates they doe the like, and somewhat provoke unto venery, but being taken too often of too liberally they breed head ach, and a kinde of perturbation of the braine, like unto drunkennesse, and the leprosie also as it is said, the sheath out of which the flowers breake, is very astringent, and to are the leaves also in the cases aforesaid: the decoction thereof maketh the haire blacke, being often used, and flayeth fretting ulcers, and helpeth the weakenesse and paines in the backe, in the bladder, and in the bowels: the Date Rones being burned and washed serveth in stead of Spodium, to binde and restaine the fluent humours into the eyes, and to confirme the pinne and web in them, and to dry up puthes being used with Spik nard, it flavth the falling of the haire from the eyebrowes: being mingled with wine and uled, it helps th any excretences out of the flesh, as wennes and such like; and bringeth foule ulcers to cicarriling: Diaphenicon, which is the Electuary made of Dates, purgeth choller and flegme very effectually, to it be taken with good caution and advice. and that from two drammes unto fixe in white wine, or a decection of Sene, as shall be thought fit, and is conveaiently given in compound and long agues, and in those diseases that are bred of raw humours, as in the chollicke the painer of the backe and mother. The head of the Dates, or Date braines, is very pleasant and savoury to the talte, and is muchased where they grow to be eaten with a little Pepper and sale: of the leaves of the Palmito they use to make Broomes to sweepe the house, which last a long time; of them likewise they make Mars, and

CHAP. C.

Acacia five Spina Egyptia. The Egiptian thorne or binding Beane tree.

TRIBEIG.

Toscorides hath made mention of two forts of Acacia, the one of Egipt, and the other of Cappadocia, and Pontus: Theophraftus also speaketh of two forts, blacke and white: that of Egipt is reasonable well knowne, but of that fort of Pensus, there is some controversie among Writers, some taking one buth to be it, and others denying it to be it, the differences of Theophraftus forts are onely expressed in the wood, as it is likely, the white to rot quickely, and the blacke to be long lasting and of very good use to many purposes, Diescorides having described them. I shall cherefore here

flew you them, and with them adjoyne another fort of Acacia brought out of the Well Indies, mentioned by Aldinus in his Farnessan garden.

1. Acacia five Spina Agyptia vera. The true Acacia, that is Egiptian thorne or binding Beane tree. The Egipt an Thorne groweth in some places to be a great tree, and rather crooked then straight or rising high. tovered with a blackift barke, foreading abroad great armes and branches, full of fharpe thornes, with many winged leaves fet on both fides of them, that is, with foure winges of leaves on a fide, made of fundry small ones, fet opposite on a middle rib, without any odde one at the end, although it be so expressed. Bellowing faith that he counted 350. of those small leaves, that were upon the whole branch, and yet alls of them might but cover his thumbe : the flowers grow among the branches, like flockes of wooll, of a whitifn yellow colour, where after come somewhat large and thicke huskes, like unto the Lupine or flat beane cods, blacke when they are ripe, and bunched forth against the places where the feedes lye, in some three or foure, and in some more, each as bigge as a small wild Beane, round, and of a grayish or ash colour, almost shining the tree abideth alwayes with greene leaves thereon, and yeeldeth of it owne accord a white gumme in small curled peeces like great wormes, and greater round precessif it be wounded.

2. Acacia Americana Farnescena. The West Indian Acacia or binding Beane tree. This Indian Access groweth like unto the Hafell nut tree faith Aldinus, with many flemmes if they be not cut away that it may tife to be a tree, with flender and flexible branches, covered with a smooth thinne barke, like the Hatell, the young ones being of a greenish ash-colour on the North side, but that next the Sunne more pale, spotted with white spots : the leaves hereon are variable, which although they be all winged, yet some have but foure leaves on a fide, fome have five, fixe, leven, or eight, with an odde one at the end, each paire fet opposite, and Qqqqqq 2

TRIBE 16

1. Acacia vera five Spina Ezyptiaca. The Egiptian Thorne or binding beanetree. 2. Acache Americana Farnefiana.
The VVeft Indian Acacia or binding beane tree.

like unto Lentilles, closing or foulding themselves upon the Sunne setting, and opening againe after the rising, having at the foote of every stalke two long thornes fer, reddish at the first, and white after: the first flowers come forthin the beginning of Inly, after some few leaves have shot forth from the old wood, but not in any plenty, yet bring the fruite to ripenesse after : but in the beginning of September more plentifully, yet without any fruite following them: these flowers at the first are greene, and like a small Strawberry, growing yellowith after, and whitish within two or thece dayes like unto a plil, or fmall round ball, confissing of a flocky or woolly substance, many of them for together, and have many small threds in the middle with yellow tips, of a very sweete sent, like unto the sent of Wall flowers, which hold their sent long after they are dry: from the middle of the flower come forth divers cods, yet fometimes but one or two, or three, and fometimes more, greene at the first, and blacke when they are ripe, like crooked round hornes, while they are greene, of a very harsh and binding tale, but growing ripe they are lesse astringent and the huske more sharpe, and then doe somewhat resemble the cods of Lupines, but a little crooked, being halfea footelong, and about an inch thicke, somewhat round and bunched out, where the feedes lye, which haske is very tough when it is dry, wherein are divers hard blacke feedes, like unto those of the sweete Beane or Carob tree, thrul thicke together without order, the wood hereof is hard and whitish, but blackest at the heart, without either sent or taste: this doth in many things agree with the former, but the greatest difference is in the huskes with feede, this having many, and the other but three or foure at the most, The like hercunto Lobel mentioneth in his Adversaria, pag. 409. that he saw with Master Mirgan Queene Elizabeths Apothecary.
3. Acacia secunda sive altera Dioscoridis. The true second Acacia of Dioscorides.

This bush hath an upright stemme three cubits high or more, covered with a smooth sad greene barke, the wood being fost and easie to breake, and not very thicke of long thornes, the leaves are small, standing three together upon the branches, the flowers are small and yellow, whose succeeding seede seated in small huskes, are round, hard, flat and yellowish, somewhat like to Broome feed: This shrub scemeth very like to the Aspalathas secundus of Dioscorides, but differeth notably therefrom, in that the Aspalathus is thicker fet with greater whiter and sharper thornes, with fewer and smaller leaves, flowers, and seede vessels, and the wood thereof is hard, and not easie to be broken.

The Place and Time.

The first groweth in Arabia plentifully in many places, and mount Sinai, and in Egipt also, and flowreth and beareth fruite twice a yeare, whereby we may well fay, it beareth ever greene leaves: the other came out of the Well Indies, Aldinas faith his came from Saint Domings, but from whence that which Malter Morgan Queene Elizabeth her Apothecary had long agoe, as Lobel fetteth it downe in Advertoria, is not knowne whether it came from thence or no, the seedes springing in Cardinall Fiernefien his Garden in Rome as it is fet forthby the

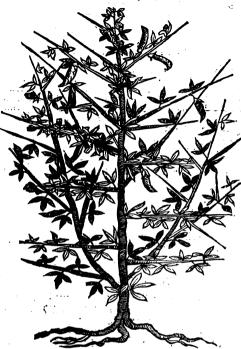

Gid Alding in his description of some rare Indian plants growing therein, and flowred and bore fruite as it is expressed in the description. The last in C. ndy and Grecia, as Pona faith.

TREBE 16.

The Names.

Dioscorides calleth it in Greeke a'saxia, and Acacia in Latine alfo, and Theophrafin auro & Spina fimply without any other adjective, whereof he maketh two forts as I faid, alba and nigra, the white being weake and quickely rotting, the blacke being strong, fit to build houses, and ships, &cc. Alpinus maketh them tobe mas and famina, the male fuller of thornes and without fruite, the female having fewer and gentler thornes, and those within the branches, bearing plenufully. Pliny alfo calleth it Spina Egyptia in fome places, diftinguishing it from the Arabica, and in others confoundeth it with the Spina Arabica, which are much differing, this being a Thiftle as it is fnew. ed among them, and that a Thorny tree: Some have thought that the Acanthus baccifera of Virgill, men-tioned in the fecond of his Georgickes, in these words Quid tibi odorato referam sudantia lieno Balsamaque Saccas semper frondentis Acanthi, should be this tice, as Servine Grammaticut, and Christoferus Landus both of them Commenters upon Virgill fav: but without true judgement as Guilandinus noteth it, who would referre it to the Acanthe Agyptia of Athanam: Marantha referreth it to that kinde of Ehome, whereof Plmy, lib, 1 2.c. 5. maketh mention, but there is as little certainety in this, as in the former. for concerning this it is not specified by Pliny, that itelther beareth berryes, or yet abideth over greene. and for the former, this Acacia beareth not, berryes, fich as no doubt Virgill meant: but it is most probable he intended, the Pyracantha, that we most usually so call, for Pliny so called it also, and Spina as some have it, or Spinus lib. 15.c.24. where he faith Buce Aquifolij & Spine fine (ucco. Bur now con3. Acacia ferunda fen elsera Diofeoridis. The true Acatta of Diefcorides.

CHAP.100.

uming the juyce of Acaria, the true and not the tublicate should be used in those two famous compositions. Mithridatum, and Theriaca Andromachi, and there is no doubt, but our Apothecaries might have sufficient of the me to use and expunge the substitute if they would be peake the true to be brought, being made there in Egipt where the tree grow eth of the greene cods, which Acacia will be reddiff, fuch as I have feene with Mafter Box s the Drugist, which is the best or else made of the cods which wi'l be blacke, for if the Apothecaries would them . the extract the juyce out of them, and condentate it secundam artem, they might have enough of the cods brought them for that use. Lobel mentioning the Acacia, in the place before recited, faith that Sequinus Martinellus. aPhylitian and Apothecary of Venice fent his brother Alberting, divers fackes full of thefe cods, whereof fome was reduced into juyce, and some of the seedes were planted and grew into trees, as Lobel there mentioneth. The bardned juyce likewise is called Acacia: some have called it Spina Christi, thinking that Christs Crowne was made of the boughes of this tree, but it is more probable it was made of the Palisrus, it is now generally through all Turkie called Aunia, and to likewise of the Egiptians, as Alpinus faith, and Sant also: Raunolfius faith that the Arabians at Haleppo, call it Scannibi and Schooke. The Gumme that commeth out of the tree, whether voluntary or by incition is called Gummi A-abicum, although divers doe doubt that the gumme that beareth that mme, is not the gumof this tree but some other, yet it is assured to be right by Alpinus, Bellonius, and others, yet there is a small tott of gurmme likewise brought to us, of the like whitenesse and clearenesse with the other, but is Vermiculofum, in small crooked peeces like unto shore thicke wormes. The second is called by Aldinus Acacia Indica Farnefiana, who hath made a long comparison betweene it and the former Egiptian. The last is remembred y Pona in his Italian Baldus.

The Vertues.

The hardned juyce extracted by decoction out of the cods of this tree, and called decid as I faid, with the summe thereof are the most especiall parts thereof we know are used, yet the juyce of the leaves and the rest worketh like them, but faire weaker: the juyce being used in all such diseases as neede binding, cooling, and ltengthning, and staying vomitting, used inwardly or outwardly; and is available in the defluxions of hot hunours into the eyes to flay them, and the abundance of womens courfes, with the falling downe of the pallate? and of the fundament, and the flux of the belly, and the spitting of blood, and all bleedings, it relisteth also creeping licre, Saint Anthonie: fire in the beginning, and helpeth the ulcers of the mouth and fecret parts, kibes, and chil-blanes, and the growing of fieth over the nailes, and to fasten loose teeth, and the sluxe of humours to the joynts, that weakeners them, and when they have beene bruifed or put out of their places; the fame also made into a secotion and the haire rubbed or washed with it, maketh it blacke, and is much commended to those that have degout the gum hath a property of thickening, and cooling, and to repress and coole the hears, and sharpe-effect humours, and to binde or close up the open passages of the skinne, and keepeth the places from blistering 1550 that are burnt with fire, being used with the white of an egge : it serveth also for Limmers to fasten their colours for Dyers also in their Dying, for inke, and many other external civil uses.

CHAP. CI.

Arbores alie spinosa & filiquosa Indica. Certaine other thorny Indian trees, bearing cods.

Have certaine Indian Thorny trees to bring to your confideration that beare cods, whereof some have beene entitled Acacia, but I call Pfendoncacia: Another very like thereunto, called by our Colony in Virginia, Locin : whereanto I have adjoyned a third which hath growne with us, and a fourth called the Corall tree, and because they are differing much from those in the former Chapter, I have

thought it fit to make a Chapter of them peculiarly.

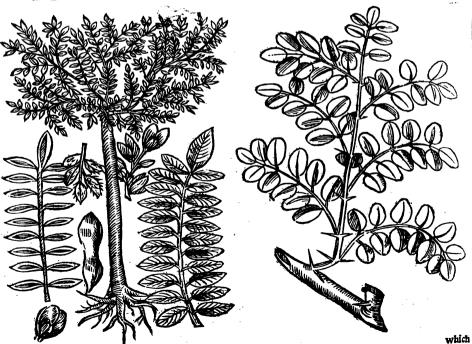

1. Pfendometic Americana Rebinic Robinus his false Acacia of America.

1. Pseudometic Americana Rebinic Robinus his false Acacia of America.

Because Jacobus Cornnius in his Booke of Canada plants, hath entituled this tree Acacia, although with little judgement; I have given it a place with another Virginia like it, but not with the true ones as is most fit. The judgement; I have given it a place with another Virginia like it, but not with the true ones as is most fit. body (faith he) is smooth, covered with a comely smooth blackish barke, without any thornes thereonatall, breading the armes and branches very farre, which while they are young are pichy within, befet with many cruell tharpe thornes, flat at the bottome, ending in a small tharpe point : the leaves are many set on both sides of a middle ribbe, from feven or eight, to terme or moreon a lide, and an odde one at the end, each leafe foulding it middle ribbe, from seven or eight, to tenne or more on a fide, and an odde one at the end, each fear following it felle double every evening upon Sunne fetting, and opening against upon the rifing: the flowers are white, fomewhat like Peafe bloffomes, or those of Cyrifus Tree Trefoile, many set together on a stalke, standing upright and not hanging downe, she wing themselves in Ingost, after which follow hard rough prickly pods, but I and others had from Robinus such smooth pods as is expressed in the figure, under the other, in each whereof was and others had from Robinus such smooth pods as is expressed in the figure, under the other, in each whereof was enclosed one or two small browne Lentill-like seedes. By this description you may plainely see how much it differeth both from the true Acacia of Disserides, and the other American of Aldinus, having nothing therein but thornes answerable : and therefore in my judgement it doth better agree with some Spartum fpinosum, then Acacia, but that it is a tree.

2. Arbor filiquofa Virgineufis foinofa, Locus nostratibus ditta. The Virginian Locus tree, A very like tree hereunto hath beene fent and brought us out of Virginia, growing to be a very great tree, and of an exceeding height with Master Transfeant, whole body is covered with a smooth barke, the young branches being greene, and let with somewhat sharpe prickles at every joynt, where the winged leaves come forth,

1. Pfendoacacia Americans Robini. Rebinm his false Acatio of America 2. At bor filiquofa Pingimenfu frinofa Locus noffratibus diffa.
The Virginia Locus tree.

3. Arbor foinofa Indian maricatie filiquis. The prickly codded Indian tree.

TRIBE 16.

4. Siliquosa & spenosa trifolium Indica arbor dista.
The Indian Corall tree.

which are fet in the like manner with the other, with an odde one at the end, and some not, but are somewhat horter and rounder: we have not feene the tree to beare any flowers with us as yet nor fruite, but the cods that came to us, were small, long, and somewhat flat like unto the pods of Laburnum Beane trefoile, but longer thinner and blacker, containing small grayish shining flat and round seede.

3. Arbar fpings Indica muricatis filiquis. The prickely codded Indian tree. The feede taken out of the prickly buskes of a tree that was brought from the Well Indies, was fowne by Mafler George Willmer at Stratford Bow, andwofeup that yeare to be three or foure foote high, branched forth on all fides, and fer with small flar pe crooked thornes, both on the maine stemme and branches, having fundry winged leaves fer on them. wery much refembling the last Virginian Locus. I can give you no further relation hereof, in that the plant perished in the next Winter after the first springing, for want of such due keeping as was fit for fuch tender plants, that come outfrom warme Countries : The figure of the prickely huske or pod, you may see set on the side of the figure, with the grayish pease taken thereout also, which was as hard as a stone, with a white kernell within them, yet not sucking in the water.

4. Silinguasa of famosa saiding Indica Coral arbor dista. The Indian Corall tree.

Cludes first, and since him Banisha Ferragios by the fight thereof, growing both at Rome and in Spaine, hath enlarged the deferintion of this tree, which I will contract into one, and tell it you thus. It rifeth up with many flemmes, whose younger barkein moothand greene, the elder pater and more rugged, spreading fairely with branches, armed with small exceled whitish thornes, and with faire broad fresh greene and almost round leaves, like unto those of Arber Jude; Jude sece, but that they end in a point, whose footestalkes also as Clusius hath expreffed, have the like crooked thornes enthan, which leaves are three alwayes fet together, the two lowest opposite on fluor foots talkes, the end one one fonger: the flowers are Peafe fashion, or like those of Phaseolus the Kidney Beane, of an orient red colour like Corall, of which colour also are the Beanes or fruite in pods, like unto other Phaleoli ; it is very tender tokeepe not abiding the least cold aire, for as Classian setteth it downe Sigwier de Toner, the chiefelt Phylician of Saullin Spaine in his time, having two trees hereof growing, which by one Wintersowersharpenetse had the make the poyled therewith. I have not altered the name hereof, whereby it is generally knowne, the it might adopt one, as I thinke more fitting thereunto, I would entitle it Phajeolus aborem spinosine Indian florence for an account for a second fire and the control of the The Place and Time.

All these foure forts came from the severall part of America, but we cannot tell you where diffinely, for the two last. but the first it is likely came from Canada, the French plantation, and the second from Virginia: The flowring and feeding is likely to be at the time of other trees at the Spring and Fall.

1552

each

The Names,

The first as I said Conneum calleth Acacia Americana, such a glorious title doth he set upon so unbesceming a Plant, I have put Robinum name thereto, because it is generally called Acacia Robini. The second is called Locus by our Nation resident in Virginia, The third came to us without name, but its likely to be the Bondach Indiano, of Pona in his Italian Baldun, which he referrent to Clussum his first strange fruite in the 30. Chapter of his feet cond Booke of Exotickes, as also to the first in the 15. Chapter of his third Booke. The fourth was first set forth by Clussum in his Appendix to his Hittory of Plants, sent him by Tovar out of Spaine, and enlargeth the description thereof, especially of the flowers in his second Appendix: Baptista Ferrarium in his Flora, or desorum cultura setteth it forth bravely, but without flowers; as having not as then shewed them.

The Uertner.

None of these have beene tryed to what grice or disease they are a remedy, but onely the third, which is it be Pona his Bonduch, as I am certainely persuaded it is, then he saith, these particulars are attributed unto it to ennoble it: The Egiptians in Alexandria account it the guardian of their children, in tying it about their neckes, to defend them from all evil chances; to preserve one from the venome of the Scorpion, to helpe the Megrime by taking some of the pouther into the noie, and the torture or writhing of the mouth, is availeable also against the falling sickenesse, by taking the quantity of two Pepper comes at a time: the quantity of a Cich Pease taken in Wine helpeth the chollicke and the quartaine ague, is a remedy for any poyson, which saith he I have not yet tryed: the fruite saith he was sent from Configuration ple, and these Vertues affirmed to be in it, and thereeseeme it of great worth.

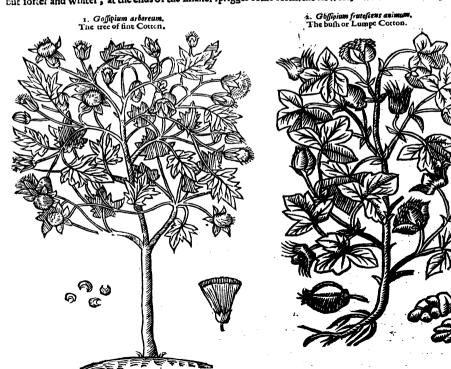

CHAP. CII.

Goffipium. The Cotton tree or plant.

Have foure forts of Cotton trees or plants to shew you that have come to our knowledge, or that we can be assured of, although Bauhimu saich there is one with a white seede, which is his sirst, whereof I never heard or read, and is likely to be mistaken, for all those Authours that he doth cite for it, doe all intend the annuall Cotton, whose seed is in lumpes, and blacke.

1. Gossium arboroum. The tree of sine Cotton.

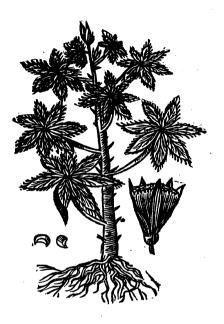

This Cotton rifeth up with a wooddy the some, to be nine or ten cubits high, spreading wooddy branches, and many broad greene leaves on them, parted on the edges into three or five divisions, somewhat like a Vine leafe, but softer and whiter, at the ends of the smaller springes come forth, the flowers, two or three at a place, but

3. Gofsipium Indiaum Spinofum.
Thorny Indian Cotton.

TRIBE 16.

4. Gossipiam lavanense longifolum.
The long leased Cotton tree of lava.

each upon a stender sootestalke, set in a broad huske of two leaves, very much jagged at the toppes, and containing therein a large yellowish flower, somewhat like a bell flower, broad above and small at the bottome, parted to the bottome into five very thinne leaves, with a stiffe reddish middle pointell, compassed with five or sixe yellow threds, which is thrust of by the fruite, rising under it, and growing to bee a small round head or ball, covered with a hardskinne, which opening when it is ripe, shewest forth a lumpe of pure white wools, having divers small blackish seede, of the bignesse of Pepper cornes, but not o round, lying dispersedly through the lumpe, and singly but one in a place, with a sweet whitish kernell within them, the route disperseth under ground and abideth, not perishing nor losing the branches as the next doth.

2. Gossium frutescens annum. The buth of lumpe Cotton.

This Cotton is yearely sowne, even in the warmest Countryes of Asia minor, and within foure monethes or little more is gathered againe from the sowing, shooting an up; ight stemme, nothing so wooddy or great as the former, but brancheth forth divers wayes, set with large and broad soft leaves, like the former, and parted alike, the slowers also stand in the tile mauner, and yellow, with purple bottomes, with buskes of fine leaves under them, after which commetts the fruite like it, but set in a shorter, smaller, thicker, and harder rough blackish buske parted into three cells, with white the standard string each of them a round ball of sine white Cotton, with altempe or bunch of greater blacke seedes by the halfe, in the midtall, and pershing as sooness it hather fested the seede.

2. Goff plan Indicam files fum. Thorny Indian Cotton.

This kinde of Cotton hards a fremme about three cubits high, fet with finall prickes, and having many faire boad leaves fet thereon upon long footestalkes, divided into leven parts, somewhat like those of Stravifaers, the flowers are like to Bell flowers with five corners, the Cotton is very fine, and the seedes are somewhat like the Thorny Mallow.

4. Geffipium Levannic longifolium. The long leafed Cotton of Iava.

This as Clusium relateth it from Fravajana Resortants, native of Bengala, groweth on a great high tree, with many farre spread armes and boughes, and stored with long and marrow leaves, neerer resembling Rosemary then Willow leaves, but than they are much longer, whose fruite was like a long pod of six inches long, and five incompasse, growing great from the stalke upwards, opening and ending in sive pointed parts, whose stimp banke was of an after soldium, and rugged, but full of most pure white soft wooll, and divers blacke round ledes within, not involved with the Cotton like the rest, but growing by themselves upon sine long wooddy puttitions, extended all the length of the cott. the wooll or Cotton was shorter then of the other, and not six be furnic into thread to make stoath, for the Natives sise it not to that purpose, but put it to another site, mannely to buffe cushions and the like-being softer then any wooll, cotton, or feathers.

TRIBE 16.

1554

The Place and Time.

The first groweth not naturally in all the lesser Afa, but as Alpinu and Belloniu and others say in the greater Assa, and India, and Brassill also, and America, and brought into Egips and other Christian Countries, but as a rainy.

The second hath for many yeares beene planted in the severall Countries of Assa minor, Phrigia, Cilicia, and other the parts thereabouts, and in Apalia allo, and in many of the liles in the Mediterranean Sea, and fowne not untill the end of Aprill, and gathered againe in the end of August or in September, the third came out of India like. wife, and the last from about Bantam in Iava, the former for ripening the fruite fome what more early then the other. The Names.

It is called in Greeke ξύλος and your mor, and to like wite in Latine, Xylum and Goffipium, and of Serapio Coto. and Bombax, as it is to also called in the Apothecaries shoppes: Some doe thinke and that not without good ground of reason; that the Byffin of the Auncients, is this first Cotton, from whence was made the Byffina tela, the fine white Callico cloath, that commeth out of the East Indies: All Authours call them in generall Xylum or Gossipium, and the first Gossipium arboreum by Alpinus, and by the Egiptians as he saith, Gotne mjegiar, it is more likely that Bellonius meant this tree by his Arbor lanifera, then that of Glusius in his Exotickes brought out of lava and fittest for cushions, and Gossipium pereme arboreum sive Asiaticum, and Brasilianum by others. The second is called Goffipium berba,to diftinguish it from the former, Baubinu calleth it Goffipium frutefeens femine albo, for lure he can meane no other fort, citing those Authours that he doth, who all I think say it is black. The third is extant only in Pona his Italian Baldus by the name of Bombage Indiano, that is Gossipium Indiano. Rambinus calleth it Gossipium arborenm caule spinofo, and faith the feede is in lumpes like the ordinary fort, when as Pona himselfe faith it is like the seede of Subdarifa, that is, the thorny Mallow, and pictureth the seede like thereunto, at the fide of the figure, and is not like the lumpe fort. The last Clufum mentioneth in the foure teenth Chapter of his first Booke of Exotickes, calling it Arbor lanifera peregrina. Baubinus that he might fay somewhat, referreth it to the Cyle of Oviedus, and questioneth whether it be not Bellonius his Lanigera arbar, calling it himselfe Gessipiano I avanense salicin folio. The Arabian Serapio as you heard, calleth it Coto, and Bombax, and other's Algodon, as the Spaniards doe: the Italians Bombagia, the French Cotone, the Germans Baumwool, the Dutch and we Cotton, and Cotton

The kernells of the feedes is used to lenefie the hoarsenesse of the throate, and to helpe those that are shortwinded, to open the passages, and for those that have sharpe distillations on their lungs, and for coughes, to make the flegme the easier to be expectorated, and encreaseth sperme also: it is used also in gripings, and gnawings of the Romacke, yea though they come by poylon, and are good also in all hot agues, the Cotton it selfe is hot and dry, and being burned stancheth bleedings in wounds wonderfully: the oyle drawne out of the seed doth smooth the skin, and taketh away spots and blemishes therein.

CHAP. CIII.

Arbor Inda. Indas tret:

F the Indus tree there hath beene cbferved two forts, one with crimfon, and the other with white flowers. 1. Arbor Inde flore purpureo.

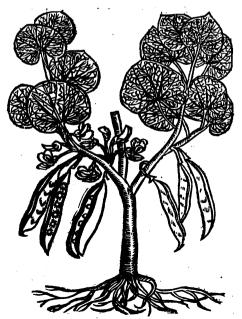

ludas tree with crimion flowers. Tais Indas tree rifeth up tometimes to be high, and of a good fize, and fometimes to be but as an hedge bush, spreading armes and branches, covered with a blackish red barke, the leaves that come forth upon the young reddish branches one at a place, are large and round, greater, but thinner then the leaves of Afarabacca, of a whitish greene colour on the upper side, and grayish underneath, falling away in Autumne: the flowers grow not at the ends of the branches, but at the joynts, and fometimes out of the very body, many flanding together upon a long foorestalke, of fashion somewhat like unto Peale blossomes, of an excellent deepe crimfon colour, after which follow fundry long flat and large thinne cods, of a reddish browne colour, with flat blackish browne hard seede within them: the roote groweth deepe and spreadeth farre.

Vaginiana. Of this fort there is one growing in Firginia, not differing from it in any thing, that I can as yet perceive. 2. Arbor Inde flore albo.

Judas tree with white flowers.

This other groweth as great as the former, but with a whiter barke, and the branches greene, the leaves and flowers are like for forme, but of a white colour, and the cods after them, nothing fo browne as in the former, and the feed likewife paler.

Arbor Inda. Indas tree.

The Theater of Plants.

The Place and Time. These kinder grow in Narbone and Provence in France, and in Spaine and Italy in many places: the flowers generally appeare before the leaves breake forth, yet bringeth not the cods to maturity in our Country, yet we have had them growne large and very reddift, but contained not any ripe feed within them.

The Names.

It is not certainely knowne that either Dioscorides or Theop'rafeus, have made mention of this tree in all their Workes, for although fome have taken it to be that Colytea of Theophraftus, which he mentioneth in his third Booke and foureteenth Chapter, but unto this he attributeth a leafe like unto Willow, which this is utterly BOOKE and toutesternis Company out unto the state of the united by the of the state mentioneth in the feventeenth Chapter of the faid third Booke, whereunto he attributeth the leafe of the larger leafed Bay tree, but larger, rounder, and somewhat like the Elme leafe, yet somewhat long with all, greene above and whitish underneath, and whereunto saith Clustus, the in the sourcement Chapter of the said third Booke attribute the code, the descriptions of both which saith he, being contracted into one, agree well unto this Arbor Inde : but by Clussen his leave, this cannot hang together; for although they in both those Chapters, that is, the 14 and 17. are colled Colytan; yet they are plainely diftinguished by Theophrastus both in their leaves, the one like a Willow, the other like a Bay leare, but rounder; and also in their fruite, that with the Willow lease hath code saith Theophras like unto Pulses: but that with broad Bay leaves, hath a Chachrys or Amentam as Gaza granulates it, and is said to be without flower or fruite, and besides hath yellow rootes: so that you may fee plainely both shoft cannot be contracted to make one plant, their leaves being declared to be so divers. Some therefore would referre this tree anto the Cercia Theophrasti mentioned in two places, the one in the said foureteenth Chapter of his third Booke, where he faith it is like the white Poplar tree, both in greatneffe and whitenesse of branches, with the leafe of Ivy, &c. which Clusius thinketh is but an ample description of the third kinde of Poplar called Lybias the Afpen tree (which Gaza translated Alpina) the other place is in the first Booke and T & Chapter, where he reckoneth Gereis to be one of those trees that beareth fruite of feedes in cods, as Colutes of Lipst a doth, so that you see in this Classim was also militaken, as Matthioliss was also before him : but indeed this description of Cores commeth neerest unto this Arbor Inde, of any other tree that hath beene likened unto it. Some have called this tree in Latine Fabago, from the likenesse of the cods unto Beane cods, and some tobe Laburnam or some kinde thereof; but the mell currant name is Arbor Inde, yet Clusten calleth it Siliqua filvefirm, not as he faith, because it doch agree with the Siliqua of the Auncients, but because the Spaniards called it Algarovo Lose which is as much as Bilique fatue, and those of Castile Arbeld amer, the French call it Guainier because the code are like knive sheathes, we have no other English name to call it by, then Indus tree, untill some other can impose a more apt for it. It is judged by many that Mathielus his sirst Acacia, in his former editions, was but a counterfeit figure of this Arbor Inda, whereunto he caused thornes to be put to make it seeme the more probable.

The Vertues.

There is no remembrance of any Physicall property appropriate hereunto either by ancient or moderne Writers, nor hath any later experience found out any : but from Virginia, we heare they account the flowers to be an excellent fallat ingredient.

CHAP. CIV.

Vitie, The Vine.

Here is a wondrous great variety of Vines that are manured, as I have shewed else where in my former Booke, some there are that grow wild, which shall be declared in this Chapter, with a recital of some of the choysest of the other.

1. 7 itis Vinifera. The manured Vine.

The manured Vine in places where it hath flood long, buth a great stemme as bigge as ones ame fleeve and all, spreading without end of menfure if it be suffered, many slender weake branches, that mult be fulfained from falling downe, the young being red, and the old of a darke colour, with a pith in the middle, at the fundry joynts whereof, grow feverall large broad greene leaves, cut into five divisions and denned also about the edges, at the joyntelike wise against the leaves come forth long twining tendrels, class pling or winding about whitefore it may take hold of : at the bottomes of the leaves, come forth clusters offmall greenish yellow flowers, and after them bersies, thicke fet together in bunches of severall formes, greatselle, colour and cafe, im forme the shalters are bloke, and others are more open, and fome being round, others more long, and some tending to a square: some likewise are very small, as the Curran Grape, others great, and some a meane betweene both: some againe are white, others blacke, or blewish, or red, or panti-coloured, and fortaltes, they are fovariable that I cannot describe them, both sweete according to the severall climates they grow in, and fower or hat fh, or mixt, more or leffe pleasant one then another, within which there are usually one two or three kernels. They that keepe their Vines in the best manner doe keepe them low, and cut them ofta, both Winter and Summer, whereby they grow the better, and take up lefte roome, bringing their Grapes both fairer and fweeter.

2. Vitie laciniath folis. The Parsely Vine or Grape with thin out leaves. This also groweth as other Vines doe, the difference chiefely confisting in the leaves, which are very much iniled or sur into many perso, oven skinokito the middle, and dented, the Grapes which are white and great, are like into the white Mulcadine Grape, and of as good and life, bearing grout buncher, and ripealing with the middle fort of Grapps.

1. Labrusca sive Uitu sylvestru Eurepea. The wild Vine of Europe. The wild Vinc In at gard it is maural, and cherefore neglected, with for the most part on the ground, and thereis made lefte fruitefull, milefte it meete with forme hedge or tree, whereon it may elline; and then fragalistic

PRIBE 16.

i Vith Varifera.
The manured Vine.

Vitis Laciniatis folijs. The Parily Vine or Grape.

the manured, being both in branches, leaves, and tendrels, like unto the manured Vine, as also in blossomes, but beareth either little or no fruite, or feldome comming to ripenesse, and what it doth is small and blacke, and no

way comparable unto any of the manured Vines, being rather binding and fowre then sweete.

4. Units fylvekria Urginiana. The wild Vine of Finginia.

This one fort of the Vines of Finginia, like all other wild forta runneth on the ground, and taketh hold of whatsoever it meeteth with, being in all things like the former wild forta, but that the Grapes are small and whatsoever it meeteth with, being in all things like the former wild forta, but that the Grapes are small and white, and with little sppe or juyce in them, and the kernell twice as bigge as others. There is another fort that hath bigger blew Grapes, and sowrer intaste. A third they call the Foxe Grape, and hath a more rugged barke, a very broad leafe, without any division almost but dented, and the Grape is white, but smelleth and tasteth like unto a Foxe.

5. Visis sylvestris trifolia Canadenss. The wild Vine of Canada.

This wilde Vine of Canada groweth like unto other the wilde Vines of those parts with siender reddish branches, climing where it can get whereon; but the leaves on them being little more then halfe to large as the manured Vine, hath onely three partitions in every leafe, but each cut in deepe, even to the long smooth stalke, whereon they stand, making them seeme as three leaves, which are of a darke greene colour, and somewhat thicke also: the fruite is like the other wild forts, having more skinne and kernell then substance or juyce.

The Chiefest Grapes are these:

The Damasco white Grape, which is the true Uva Ziboba; that the Apothecaries should use in fundry of these

compositions.

The Muscadine Grape both white and red,

The Frontignacke or Muske Grape.

The party coloured Grape.

The Raisin of the Sun Grape. The Curran Grape is the small blew Currans that the Grocers sell, and have no kernells, whereof there is ano ther fort that beareth red berries, almost as small but not so sweet, or rather a little tarter.

The imall carely blacke Grape.

The blacke Grape of Orleance.

There is a Grape without flones growing in fundry places, as by the River Sorete meere Afealon in Palofina; giving a red wine, as also in divers places of Arabia, &c. and in the Maderas, &c. There is reported also to be one that beareth greene leaves continually, yet yeeldeth fruite but at the time that

There is faid likewife to be some that beare twife in a years, and some oftener, having both ripe and great fruits together at one time upon the tree,

The Place and Time.

The manured kindes are planted every where, and according to the foile and climate is both the rellish and frength of every fort, for the Vine that groweth in the Canary Islands, is the same with that at Malaga and Shen if and yet the one fail excelleth the other in strength and sweetnesse. The other wild forts are all expressed in their titles: the fifth wild fort in fundry places of Europe, both Italy, France and Germany. The wild forts flower tomewhat later then the tame or manured, and therefore what fruite they beare, must likewife be later ripe thei others.

The manured Vine is called in Greeke aumin o bucoppe and nup , and in Latine Vitis Vinifera, and fative of relis: the Wilde is called anno dyers, and in Latine Vitis fluefiris: Vitis avino, vel quis invitetur ad nues spienda dicitive, but there is another Ville folvestrie of the Grecians, that is the Clematic wrens of the Latines by iome, and the Americalism by others, when as this is called Labringer, to cause it to be knowne afunder ; the juyce of the unripe Grapes of the manured Vine, or rather of the Grapes of the wilde Vine, which come not to appendix are called hopened in Greeke Omphacium, and Agrefia in Latine, in English Varjayce: The Grapes when they are dryed in the Sunne are called Une passa, and Passales Rasins: the juyce or liquour pressed our of the ripe Grapes is called Vinum wine : the kernels are called pragra acini, the dregs or fetling of the Wine, are called Vinifeces, Wine less while they are moift, but being dryed is called Tartarum, Tartar or Argoll, the defilled Wine is called Spiritus vini, or Aqua vita, the spirit of Wine or Aqua vita. In the wild Vine the flowers are called and on and Oceanithe, that is Vini flos in Latine, which was of much use in former times, but now is Wholly neglected. The Arabians call the Vine Harin, Karin or Karni, the Italians Vite viniferera, the Spaniards Vidand Parra, The French Vigne, the Germanes Weiureb, the Dutch Win gaert oft Wunstacke.

The Vertues.

The Vine hath in it divers differing and contrary properties, some cold, some hor, some sweets, some sower. fome milde and some sharpe, and some moistening, and others drying: for the leaves and young branches are cooling and binding, and good to be put into lotions for fore mouthes, or other parts, and in drinkes against fea. Sarmenta vers: being bruifed, and with Barley meale applyed to the temples eafeth the head ache comming by heate; and branches applyed to the ftomacke, eafeth the inflammations; and heat thereof: the juyce of them being drunke stayeth and leaves. me laske, caftings, frittings of blood, and womens immoderate longings. The after of the burnt branches, or Cineres clapeffing, made into a live and drunke, is very effectuall for the stone and gravell in the kidneyes being mixed vellat act with a little vinegar, it confumeth the warts of the fundament, and the inflammation thereof being bathed there-vium, vine with, it doth marvellously ease the paines, and taketh away the swelling. The said lye of Vine ashes, is good ashes and wash places out of joynt, or burnt with fire, and used with Rue and vinegar, is good for the swelling of the the lye of pleene : and used with wine, it helpeth Saint Anthonies fire : the said lye also helpeth frettings and gallings in them. my place i the affice made up with axangia, is good against hard tumours, clenfeth fistulates, and hollow ulcers. and healeth them up afterwards, helpeth the paines and fhrinking of the finewes, and being mixed with oyle afeth those places that are bruised by falls or otherwise, and cureth the bitings of Scorpions, and dogges: used with vinegar and niter, it wasteth away Wens and other excression the stefn. The water that droppeth from Lathryma the Vine, when it is cut out of due time, being drunke helpeth to expell and wash downe the gravell and Rone in Vine water the kidneys. The Gum that iffueth out of it lelfe flicking to the barke, being drunke in wine doth the fame or bleeding to the barke, being drunke in wine doth the fame. (but that we foldome fee any fuch in our country, and therefore may fafely use the water in the stead thereof) Gunnet. and being bathed on the skinne taketh away (cabbes, tetters, the morphew, and the leprous (curfe, if the places The gum, be first washed with niter: The said Gumme or the water that droppeth from the greene branches, when they are burned, being used with a little cycle taketh away haires and warts. The fresh Grapes being eaten, doe mit to the stomacke, helping to stay spittings of blood, but affect the head and the b'adder: and are forbidden in Pessuand gues a being hung up and dryed a little, or made into Raifins, they doe helpe to loolen the belly, especially if they Raifins. besken without the kernells, which are more drying and binding, to be taken in pouther of themselves then any Actas five ther part of the Vine: Those which are called Rasins of the Sunne are the best for this purpose with us, and for Arith. The my other use in physicke: and herewith are made Tisane drinkes, to helpe coughes, hoarsenesse of the throate, Grape ker-bottnesse of winds, toughnesse of slegme, causing it the more easily to be expectorate, and doe lenesse sharpe ad naufeous humours, that offend the mouth of the flomacke : they ferve likewife to open the oblituetions of deliver, fpleene and bladder, and taken by themselves they nourish much, by reason of their thicke sweete and imperate substance, whereby also they stay not long nor pruttifie in the stomacke. The small Raisins or Curhis are very nourishing likewile, and somewhat opening the belly, especially being stewed with some other Passule Cethings conducing thereunto, as with a decoction of Sema Rubarbe, and other such like things, according as occafrom shall neede i. The Damasco Raisins have a little tartnesse in them, whereby they are most gratefull to the Passula Damacke, and excellen the Raisins of the Sunne for all the purposes aforesaid. The juyce of the Grape is of two malene. the is a fine carr liquour fit to be used in brothes, meates, or saves, to sharpen the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite, Agesta specific for the stomacke, to get an appetite for the stomacke, to get an appetite for the stomacke, to get an appetite for the stomacke, agest a specific for the stomacke specific for the stomacke, agest a specific for the stomacke, agest a specific for the stomacke specific for the stomacket spec de to refresh and quicken fainting spirits: Of this juyce is made a syrupe of especiall use in the like earlies: the Ombasium. Whe is of to many fundry forts, as not onely the Grapes, but the feverall climates and toyles wherein they grow yarjuyce. The weaks Wines are very rheumaticke, and clenic much: the strong wines are very heady, and enflame blood very mich; those of a middle temper are most proper for our bodyes (who use act willingly or orwilly, to allay or temper our wine with water, unleffe the Vintner doe it without our knowledge or confem) most whole form for our health, and most in use for Physicke, both to boyle in affinkes, and to serve as the Michiam, to extract the Vertues of whattoever shall be steeped in it, And is distributed into many parts, for Wit is made both Sapa and Defrasam, in English Cute, that is to fay, boyled wine, and both made of Masteria

Wine, the later boyled to the halfe, the former to the third part. Then there is Lora which is a final kind wine, like our small becree, by putting water to the pressings, and pressing them over againe, but Because we Lora Small

Too use of such with us, I forbeare to speake further of it, Acetum, Vinegar, that is lowre wine, which is as VVine

other ingony wow mainre open as Pliny speaketh of the former, for it is made by fetting in the Sunne, which exha-

CM A P. 104.

Ale or

ling the purer spirits, and by the heate causeth the other to grow acide, and is of great use, both in health and fickenefle, both in meate and medicine: but now adayes we have fuch a baftardizing, and falification thereof Sapa Cute that we scarfe can get any right to use. The Sapa and Defrutum differing but onely in the manner of boyling. I may comprehend them both under Cute, and was devised to serve instead of hony, as Pliny faith, it belieth the cough and faortnesse of breath, and to expectorate tough slegme from the chest and lunges, it also easily passets through the belly, and maketh it folible, Vinegar contrariwise is cooling and drying, as the Case is heating and moistening, and therefore serveth to correct the heate in seavers, and to resist purrefaction, it cutteth tough flegine, that is hard baked, and not easily brought up and spit forth: it is sharpe and penetrating, and very utefull in scabbes, itches, tetters, ringwormes, and fretting and creeping ulcers, to correct their malignity, and extirpate their corroding quality, but is offensive to the sinewes, by its piersing and drying property, causing them to thrinke. But the destilled vinegar is of a more fiery and penetrating quality, which it gaineth by the destillation thereof, the manner and order in this being quite differing from the destilling of Wine, wherein the purest and stillitum strongest spirits doe first rise and come forth, when as in vinegar almost two third parts are taken from it, which Destilled are the weakest, before the last and strongest rifeth, but not the last which is the Empreuma, and serveth even as the vinegar it felfe doth, but with more force, and as the Vehiculum, wherein the tincture and spirits of simple medicines are referved: But to speake of Wine, from whence all these are made and derived, is to enter upon a little fea of matter: for to shew you all the severall colours, fents, strength, ages, and tastes of simple wines. were too tedious and needlesse also, and so is it likewise to shew you all the forts of compound or artificiall wines pofita five which are as infinite as the herbes, rootes, seedes, or other parts of them are, and take their names from the seveattific a rall ingredients that compound them, as for example Wormewood wine, Eyebright wine, Scammoniate wine lis Artifi- or wine of Squilles & fic in infinitum, as I may fo fay, each whereof hath the property of that herbe, roote, &c. cill wines that was put into it, while it was Mult, that fo they might worke together, but fimple Wine being not made with Taristas us, these artiscial Wines are not in use with us, yet might be paralleld almost, if the things were put into our Septentia new Ale, or Beere, to worke in them, as wee use to doe with out dyet Beere. Yet other torts of compounded enath. Our Wines might be made for fundry physicall uses, after the manner of our Hipocras wine, which is according to the compound spices put thereinto, cordiall and comfortable, &c Metheglin is a Welfb (ilrange) drinke, not made of Wine, and therefore I would not reckon it among these Wines, being fit for some stout Welfe stomackes that affect it. The receipts of many whereof are extant in Lobels Appendix to his Adversaria, whereunto I referre you. I will therefore touch onely the particular properties of wine it felfe, both as it is medicinable and nourifhing, for ta-Hipporta- ken moderately, and by them that are of a middle age, or well flept in yeares, or are of a cold and dry diffosition, titum Hi- and (not very young, and so their blood too hot for to abide Wine) it encreaseth blood and neurisheth much: it procureth an appetite, and helpeth to digest being taken at meate, it provoketh urine and driveth forth raw humours thereby, strengtheneth the vital spirits, and procureth a good colour in those that want it, or are macilent, drawing to a confumption, to as it be not accompanyed with a fever, it expelleth feares, cares, and heavinesse, and breedeth alacrity, mirth, and bodily pleasure, and by the moist warme vapours, causeth quiet rest and fleepe, both to the found and ficke that lacke it; it likewife comforteth and warmeth all the cold infirmities of the flomacke, liver, spleene, and wombe, and helpeth windy swellings in the body, and generall evill dispositions thereof, the greene fickeneffe, and the dropfie, and the over travelled, over wearyed body and minde, it is also the remedy against Hemlocke, Coriander, Poppy, and Opium, Wolfebane, Mushromes; and Mandrake, or whatfoever cold poyfon or dangerous herbe, or roote is taken; These be the effects of the moderate drinking of Wines when as on the contrary fide, the excesse thereof breedetha distraction in the senses, the Approplexie, and Lethargy or drowsie evill, the trembling of the joyats, the passe, and the dropsie, but is used to heale up old users, and sores, no other mossure being admitted in the cure. The spiritual wind The in former times one unto another, that there was no more difference betweene them then betweene the stronger and the milder Wine, for Aqua vite being made wholly of Wine, with the addition of spices made the spirits to be the stronger, and the wine simply without spices to be the milder; but now there being not one droppe of Alia vite Wine in the Aqua vite, is wholly destilled from the tilts or dregges of Ale or Beere, being their low Winesas it is called, and after distilled againe with a few Anneseedes, or as some due with a little Ginny Pepper, to make it the stronger without any other spice, commeth farre short of those auncient receites for the making of that which was good and wholesome: to tell you therefore the effect of our Aqua vita, were not to tell any part of the nature or quality of wine, but of Barley and Hoppes, which make Ale and Beere, I will therefore shew you the properties of the spirit of Wine, which if you will transferre to Aqua vite you may, but to farre weaker effects: for hereby shall you know the goodnesse and strength, by setting it on fire, with a paper lighted, the pure spirits burning siercely, and will all most be wholly consumed: the other burning but little, and leaving an insipide and much watery part behind it : the purer therefore that it is, the stronger it is, and the lesser of it to be taken at a time, and that not of it selfe, but in some Wine or other liquour, for feare of inflaming the blood and spirits, and chiefly upon symptomes and passions of the heart : and then taken with respect and good consideration, it worketh much more effectually then the Wine it selfe doth, to all the purposes aforesaid, in comforting and nourishing the naturall heate in elder persons, giveth strength and quickenesse to the sences, and nerves, repaireth memory, and the cold and moist diseases of the braine, helpeth the fainting and trembling of the heart, warmeth a cold and moilt stomacke, helpeth digestion, expelleth winde from the sides and belly, and all cold poylons a being outwardly applyed to the temples, it easeth the paines in the head, and cold deftillations, and the toothach, being gargled a little, and cicatrifeth all fores, yet respect must be had, that it be not given where any feaver is, or where the disease proceedeth of heate, or is accessary thereunto, for feare of hardning the liver and spleene, and making chollericke persons the more enslamed: These spirits of Wine, as well as the Wine it selfe, serves as a Vebiculum or menstrue, to draw out the tincture of divers things. And now lastly to speake of the Lees of Wine, which being hardned is called Tartarum, Tartar or Argoll, and that which is taken from the whitest Wines is accounted the principall best for any medicine : but the red fort serveth Gold smiths and others, to pollish their silver, and Dyers in setting their dyes : the best white Tartar is either given of k selfe simply being made into pourher and taken, the quantity of a dramme at a time in some convenient drinke or broth, for some time together in dropsies or evill dispositions of the body, to expell both by urine and siege, those

wheyish watery humours thereof, and applyed to womens brefts that are over full of milke, doth dry them up, but the Cressor Tartars which is the purer part thereof, and especially it it be made as cleare as Criffall, (the highest worke of art in that kinde) doth worke more fafely and more effectually then the Crude Tartar can doe: but this Tarear that is calcined untill it be white, hath then put of all purging quality, and hath gained a causticke burning property, that will corrhode and eate away scabbed nailes and warts, and soone be brought into a falt, and will also foome be resolved into an oyle or liquour, if it be either laid upon a stone, or hung up in a linnen bagge, in a moilt feller to be received as it droppeth downe, and is the most admirable opsfex in Alchimy that ever was manner, and not to be paralleld with any other thing, that I know: but to flew the operation of it in feverall medicines by precipitation or otherwise is not for this Worke, it must be fought out of those professed Authors of the Spagyricke Art, to whom I must referre you: There is another kinde of oyle of Tartar, of a farre milder temper and is morelike unto a cleare water, which is very effectuall to clenie the skinne from all manner of spots fearres, morphew, or discolourings whatsoever, and maketh it smooth and amiable, and where there is cause to apply it, will helpe to bring on haire on the places decayed. The wild Vines are in property no leffe cooling, but more binding then the branches of the manured, staying the laske and spitting of blood, provoking urine, and Labrusea. but more original the original to the translation to the translation of the original to an hot floracke, or that loatheth meat: the leaves hereof are as good for lotions, as of the other for Vinc. fores in the mouth the privy parts and the fundament; the after of the branches are likewife used to cleare the evelight of filmes, and what elfe may offend them, to clenfe fores and ulcers, and to take away the over growing skinnes of the nailes of the hands or toes.

Absque aril.

CHAP. CV.

Berberie. The Barbery bush or tree.

He Barberry bush shooteth forth many slender stemmes or stalkes from the roote, sometimes to a great heighth, covered with a smooth whitish rinde or barke, and yellow next the Wood, which is white eafie to breake, and pithy in the middle, fet full of fharpe (mall white thornes, and three at every leafe allmost, which are somewhat small and long, finely dented about the edges, and of a fresh greene colour: the flowers come forth at the joynts with the leaves, many standing on a long cluster, yellow while they are helh, which turne into small long and round berryes, hanging downe in long bunches, upon a small stalke white at the first, but very red when they are through ripe, of a sharpe sowre talte, able to set their treth on edge that thall cate them, the roote is yellow and fpreading.

There is another fort, whole berryes are thrice fo bigge as the former, not differing in any other thing.

There is another also, whose berryes for the most part are without any stones or kernels in them, or but here and there fome.

The Place and Time,

TRIBE 16.

It groweth in many of the woods in Auftria, Hungaria, and in France also, the blossomes come forth in May, and the fruite is ripe in September, and Otto-

The Name:

It hath formerly beene held by very good and learmed Authours, that this bush is the Oxygeantha of Diofcorides, and hath continued to this day, especially among the Apothecaries, yet Cordes accounted it an errour, and therefore would rather call it the Oxyacanthos of Galen, then the Oxycantha for Dioscorides, and so, doth Camerarius also, but we have shewed ellewhere what the true Oxyacamba of Diofcorides is. even the Pyracantha which hath ever greene leaves. and red friable berryes, neither of which can agree with this Barbary bush. Others againe have taken it tote the Spina appendix Pliny, but Glassia hath shewedthe unlikelinesse of that opinion. Matthiosus and Cefalpinia call it Crespinus, because the vulgar Italiand doc call it Crespino, and some thereafter in Latine Unacrespina, which some attribute to the Goose. berry, but many others doe call it Berberis, and to the generall vote goeth now adayes. The French call it Effine vinetse, the Germanes Erbfel, Santacke, and Verfing the Dutch Samerboom, and we in English Barberryes.

The Vertues: The leaves of Barberries make a fine tart fawfe like unto those of Sorrell, and serve to coole and refresh a fainting hot flomacke and liver, and repressing sowre belchings of chiolier, and is therefore good for aguish people: but the fruite is much more cooling and binding, quenching thirst, and restrayning chollericke and Pelilentiall vapours, and is of very good use in either Berberk. The Barberry buth or tree.

TRIBEI6.

of the agues of that nature, if the conferve or the depurate juyce, or the fyrupe thereof be taken with the sympe of Violetts the faid juyce also or the berryes the melelves preferved is often used for those that loath their mean. to procure an appetite, and represse the force of choller, rising from the liver thereinto, and that which passes in to the bowells procuring tharpe laskes: it helpeth likewife to they womens immoderate couries, and if it be taken with a little Southernwood water, and fugar, it killeth the wormes in the body: it is good allo for those that fpit blood, and to falten loofe teeth, firengthen the gummes, and coole the inflammations of the palate and throat, and flayeth theu mes and destillations upon those parts: it helpeth likewise to dryup most; ulcers, and to loder up greene wounds: the said depurate juyce called wine of Barberyes, serveth to dislote many things thymically: the inner vellow barke of the body, branches or roote is with good facceffe given to those that have the vellow jaundile being boyled and drunke: Clusius fetteth downe a fecret that he had of a friend, which is, that if the vellow barke were laid in steepe in white wine for the space of three hours, and afterwards drunke, it would purge one very wonderfully.

CHAP. CVI.

Uva crispa Que Grossularia. Gooseberryes.

Here are fundry forts of Gooseberryes, chiefly varying in the fruite, some being larger or smaller then others, fome red fome greene or yellow, fome blew, fome round, fome long and fome fmooth, and some hairy or prickely, which although I have shewed them elsewhere, yet it shall not be amisse, to remember them here againe.

. Groffularia vulgaris. The common Goofeberry. The common Goofeberry bush feldome rifeth up to the height of a man, with a stemme as big as ones thumbe, or more, at the lower part, covered with a smooth darke coloured barke, cleere of thornea thereon, and so like wife for the most part on the elder branches, or with a few onely, but the younger are whitish, armed with very thatpe crooked thornes, which no bodies hand can well avoid that toucheth them, whereon grow fmall cornered greene leaves, cut in on the fides, but broad at the bottome next the flaike: the flowers are small, and grow at each of the leaves, one or two together, of a purplish greene colour, hollow and turning up the brims a little : after which follow the berryes, bearing the flowers on their heads, and are of three forts, that is small, or great that are round, or thet are a little longer then round, greene before they are ripe, and With a thicker skinne then the other , but of a greenish yellow colour when they are ripe, ftriped in divers places electe and almost transparent,

I. Veacrifpe five Groffularie fylveftrie.
The common Goofcberry.

2.3. Groffularie rubre to carules. Red and blew Gookburryes.

with small blackish seede lying within the pulpe, which is of a pleasant winy taste, acceptable to the stomacke, and without offence, although one doe eate many of them : the longer berry hath the thicker skinne, and the wor-

2. Gossalaria rubra. Red Gooseberryes.

The red Gooleberry is of two or three forts: one hath slenderer stemmes and fewer thornes on the younger white branches, which bend downe more then the former: the leaves are made after the fame manner, but a little larger, the flowers and berries are like the other, but are of a darke brownish red colour, almost blacke when they are through ripe, of a full some sweetish talle, and never beare many in a yeare, which make them the leffe regarded : Another fort is like the former in growing with little difference ; onely the berries are smaller, redder, and of a pretty tart tafte, and i weet withall : A third fort groweth very like the ordinary fort of yellow, both in heighth, branch, and leafe, the berries are as large as the largest fife of the other, and of a very fine red colour, untill they be suffered to hang long on the bushes, which then are of a darkish red colour, very pleasant in

3. Goffularia cerulea. The blew Gooleberry.

The blew Goofeberry rifeth up to be a small bush, having broader and redder leaves at the first shooting out. then the second red Goose berry, the berryes are more sparingly set on the branches also, and for bignesse neere unto the small red Gooseberry, but lesser, and somewhat sweete, and of a blewish colour like a Damson, before the colour be wiped off.

4. Gossalaria viridia birsuta. The hairy or prickely greene Gooseberry.

This greene Gooseberry is very like unto the ordinary Gooseberry, in temme and branches, but not furnished with such sharpeprickles as it, the younger branches also have smaller greene leaves : the flowers are alike. and so are the berryes; of a middle size, but greene when they are through ripe, with a shew of small haires or prickes on them, which yet are as harmelesse as it there were none, but of a more pleasing reliish then any of the other: the feede hereof hath produced bushes bearing smooth berries, with few or no haires on them. The Place and Time.

The ordinary forts grow usually in the hedges, in fundry places of France, but I thinke rather planted there for defence onely, rather then that they are naturall to the Country, for even there as well as here, they are planted in Gardens and Orchards alfo: all the other forts likewise are kept in Gardens: they all flower very earely in the Spring, prefently after the leaves begin to come forth, and the berries are tipe from the middle of Inly to the end of August, or as the yeare proveth.

The Names,

It cannot be certainely knowne that any of these fruites were knowne to any of the ancient Greeke or Latine writers, for although some have referred some of them unto the ios or olor, 1/0s, or Oefos of Theophrastus, whereof he faith one hath a white flower and fruite, and another both blacke, yet he remembreth no thornes in it, as that hath, which so curious a Writer would not have omitted, and therefore is not likely to be this: some againe would have it to be Fitis precise of Pliny, but that cannot be, because he numbreth it among the other forts of Vines, that beare wine as one of them: Gefner in horeis taketh it to be the Ceanothus fpina of Theophrastus, but Anguillara rather judgeth his Ceanothes to be a kinde of Thiftle, whereof we have entreated among the Thiftles: it is called Venerispa by divers, and Venerispina, because the leaves seeme to be crispt or curld, and Gossalaria by others, because they are like Grossos small greene Figges, and by some also Venerina, but I know not upon what cause. The Italians call it Uva frana, the Spaniard Uva crespe, and Espina, the French Groselles, the Germanes Krussbeer, and Kruselbeer, the Dutch Stekelbessen Knoselen, and Croesbessen, and we in English Gooseberries, but in some places Feaberries, and Wineberries. The Vertnes.

The greene and unripe fruite of the ordinary forts are somewhat sharpe and tast, and serve to religh brothes for the ficke (as neede requireth,) as well as the found to stirre up a fainting or decaying appetite, or overcome with chollericke humours, but otherwise yeeld small nourishment to the body, and that but cold and crude, for they doe a little helpe to binde the belly and flay fluxes of blood in man or woman, and flay their longings; yet they are not to be tollerated to cold or windy stomackes, least by breeding more winde they bring the chollicke, and griping paines in the belly: the juyce of the berries or of the leaves, is helpefull to coole and restraine hot swellings and chollericke inflammations, called Saint Anthonies fire : the ripe fruite is more pleasant, and more defired for the sweeteneffe to be eaten at pleasure, then for any proper or speciall effect for any disease, but by reaon of their good and sweete rellish, and most lubricity, they easily descend out of the stomacke without any of fence at all.

CHAP. CVII.

Ribes frustu rubro, albo, nigro. Red, white, and blacke Currans.

He stemme or stocke of the red Curran bush, hath a very thinne brownish outer barke, and greenish underneath, and of the bignesse of a good great staffe, wholly without thornes on any branch, whereon grow large cornered blackish greene leaves cut in on the edges into five parts somewhat like a Vine leafe, but a great deale leffe, the flowers come forth at the joyats of the leaves, many together on a long stalke, hanging downe about a fingers leagth, of an herby colour, after which follow round berries, greene at the first, and of a cleere red colour when they are ripe, of a little

pleafant and tart tafte withall, wherein Iye (mall feed: the roote is wooddy, and fpreadeth diverfly,

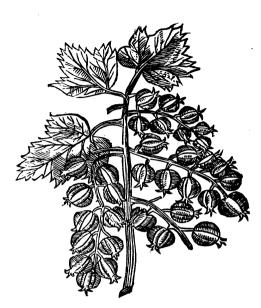

There is another fort hereof, whose berries are twise as bigge as the former, and are of a better relission. The white (urran bush hath a taller straighter stemme, a whiter barke, smaller leaves, and such like berries jore, apon long stalkes, and of the same fife and bignesse with the first or most ordinary, but of a shining transparent Rives also

with

white-

1. Aibes frueturubro majore. The greater red Currans.

White Currans 2. Ribes frulla albe.

3. Ribes frattu nigro. blacke Currans.

whitenesse almost like Pearles, the seed within them being plainely to be descerned as they hang on the builies, and of a more pleasant winy talte, much more acceptable then the former. And is called Gozel as I am informed, in some places of Kent.

The blacke Curran riteth higher then the last, more plentifully flored with branches round about, and more pliant alio, the younger covered with a paler, and the elder with a browner barke : the leaves are iomewhat like the former but imaller, and often with fewer cuts or devisions therein, the flowers also are alike, but of a greenish purple colour, which turne into small blacke berries like the former: both leaves and fruite have a kinde of strong evill fent, but yet are wholesome, although not so pleasant as any of the to mer, and eaten by many.

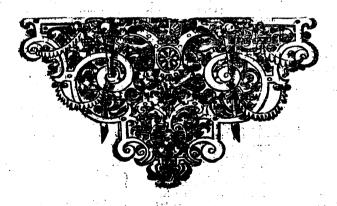

The Place and Time.

The name of Ribes and Ribesius frutex is generally given to these plants for some likenesses, not onely in the berries, but much more in the properties to the Ribes of Serapio, which as he saith bath reddish greene tendress large round greene leaves and berries, whole taste is sweete with some tartnesse, and are cold and dry in the second degree: This is the description of Serapio his Ribes, and although all doe generally consent it is not that of Scrapio, as not having tendrels nor large round leaves, yet is it generally received in the flead thereof, onely Dodonew would frame it into the same mould, but I doubt his skill is too weake, and his allegations too much wrested or too selfe conceited. Some have thought this to be more answerable unto Theophrast his Ifor because this hath no thornes as the Goofeberries have as Lobel doth alfo. But Bellonine in his Booke de coniferie arberibus. and Rauwolfim doe both fay they found the Ribes Arabum on the mount Libanm. Bellonius describeth it with fixe or seven leaves of a Docke, but greater and rounder, rising from the roote, and with red berries hanging downe in clusters, comming out from the middle of a leafe, like as the Rusen, and Lastrus Alexandrina doe. Ranus fine

faith, he found it onely with two large round leaves like unto the Petalites, from whose stalkes a sowre suvce is prefied that is pleafant, and wied of the richer fort, whereof breaufe we have no further knowledge, we here leave them. Gefour called this Computer levis: most doe account it a kinde of Groffelaria, and therefore call it Groffueria robra, and Graffaloria ultramusina. Clustus only and Besser in horto Exterens, make mention of the white Ribes, and Banhinus orbo-callech it Groffaloria bortossis in ungaritus finisse: The blacke fort is generally called Ribes fruttu nigro, yet Gosper in horto the within that some would make it to be a fort of Amomum, and therefore called Amomum falfum or Pfeudoamomum, and some Pipirella as Lugdunensis faith. The Italians call it Vnettaroffa, the French Groifelles dominemer, the Germans St. Johans erenblin and Sant Iohans beordin, and Keozbeer, as Gefner faith the Dutch Besiekens over zee, and we Red Currans, the white Ribes as Lam given to understand, is called Gozell in some parts of Kent.

The red and white Currans are good to allay the heave and fainting of the stomacke, to quench thirst, and to provoke an appetite, and therefore are fafely permitted in hot and tharpe agues, for it remocreth the heat of the liver and blood, and the tharpenede of choller, and refifteth purrefaction: it taketh away like wife the loathing of meate, and the weakenesse of the stomacke by much casting, and is good for those that have any loosenesse of the belly: Gefner faith that the Swiffers about Berne where it naturally groweth, use it for the cough. The blacke Currais are used in sawfes and so are the leaves also by many, who are well pleased with the talle and sent of them although some doe millike them for both.

TRIBE 17.

EXOTICE,

PEREGRINÆ PLANTÆ.

STRANGE AND OVT-LANDISH PLANTES.

CLASSIS VLTIMA. THE LAST TRIBE.

CHAP. I.

Agallochum sive Lignum, Aloca.

NTRING now into my last quarter, so to consummate this revolution, I must use another manner of Method, then formerly I have done in the precedent Tribes; for intending to shew you as well those Out-landish Plants, that are called spices and drogues in our Apothecaries shoppes, as other fruites and strange trees, growing in the East or West Indies, I would first perfect the more usual Physical part of them in an Alphabeticall order and with them infert a few other, the more principall things, although not plants, or taken from them that are for the most part in our shops used in medicines, shewing the place and names of them all in a continued stille, and not in fractions, as in the foregoing parts.

Lignum Aloes, or the wood of the Aloe tree.

Apartoger if Europarkin Agallochum and Xyloaloe in Greeke, is called also Agallochum and Xyloaloe in Greeke,

chum five Ligamm Aloes in Latine, and so in English, or the wood of the Aloe tree, is a drogue rare to be had, and of much worth: but (as it is with many other things that come out of the East Indies unto us) of small know-ledge what it is, and where and how it groweth. For but that Garcial as Orta saith, that the tree is like unto an

Ollive tree, and sometimes greater, and that he had the branches of the tree brought him to see, but neither flower nor fruite, the places being very dangerous by the haunt of Tigers therein, we should not know what forme is bore; none of the Ancients either Greeks or Arabians, having fet downe any thing thereof, although they have all mentioned it, and the choyce of the belt, with the Vertues. onely Serapio in the 197. Chapter of his Booke of Simples, faith it beareth small berries like unto Pepper, but red : yet Garcias maketh some doubt thereof, as he doth of fundry other his relations in that Chapter. For although Serapio in that place reckongth up divers forts, and Ruellism spea-keth if fourespectaries faith, he knew but one true fort of Ligsum Aloe, which grew in India, and that the other forts that were so called, were but sweete woods affimulating it, but were not the true and right wood, which the Arabians call Agalugin and Hand, and they of Surras and Decan, Vd, as it is likely from the Arabians Hand, which word with them properly fignifieth but Lignum wood, and rat' \$50x20, praftantissimum; but they of Malacca and Sumatra where the true groweth, call it Garre, and the best

Agallochum five Lignum Aloes. Lignum Aloes, or the wood of the Aloe tree.

Columbac: yet as Garcias faith, that that fort of fweet wood that commeth from Comorin, and Zeilan, and there alled Aguila brava, that is to fay, Lignum Aloes Sylvefire, is not true Lignum Aloes, Which true fort as all the Anneient Authours doe fet it downe, is a blackish wood in peeces, some accounting the greater peeces to be the hener, but yet somewhat discoloured with veines, (some Authours saying it is so weighty and heavy, that it will finke and not fwimme being put into water . but others doe not allow of that note, taying that the best that is will (wimme) and full of an oyleons substance, of a fine sweete and aromaticke fent, which it will sweet been, when it is burned: Now to come to our later times and flew you, that for many yeares together (as brany of full like rare drogues) true Ligaum Alest was not knowne to the Phylicions or Apothecaries of Entany for they used instead thereof a kinde of Ligaum Rhodium, which Ruelline tooke to be Apalathus, and but that the Ventians of late dayes by their travell and search, both in Cairo and the East Indies, caused some of the true for to be fent unto Venice, and was upon view and tryall approved, the Portugalis Sea voyages to the East Illidies, did first make it knowne in these later times to Christendome : but now in our Droguist and Aparticenties dies, did first make it knowne in these later times to Christendome: but now in our Droguist and Aponicessies shops there is much variety and counterfeit stuffe obtruded on the ignorant, divers sorted to be teene, and ye fearce one of them true Lignum Aloer, having those markes and notes formerly set downe, and extnowledged by the Ancients, which are the onely true notes whereby to know the best: and such no doubt is our best sort, which are knobbed or uneven peeces, very brittle, and breaking short, somewhat blacke on the outside, and one gray and discoloured within, of a very small sent, untill the burned; yet I have seene with Master Tradescant the elder before he dyed, a great peece of true Lignum Aloes, and of the best fort, as bigge and as song as a man legge, without any knot therein, which as he said our King Charles gave him with his owne hands, but was here kept before, and accounted by many, as a great religious rellicke, even to be a peece of the wood of that Croffe, whereon our Saviour was crucified, and therefore was fetched away agains from his Sonne, to be keps as monument or relicke ftill: but this is like all the other relickes in the world, even meere Impoltures, for sfaredly if all those peeces of wood, that are or were to be found in the world, faid to be parts of that Crosse. were all fet together, they would goe necre to make one, yea many cart loads full : yet fo fond and fuperfittious are men to believe lies rather then truthes, that they will rather kill the gainefayers, and thinks that therein they see God good service, then be wise to see their errours. The other forts which are smooth and plaine, with long graines are no true Lignam Alors, although so called, being neither of that worth in price, nor goodnesse ineffect. The propertyes whereof are very cordiall for the heart, and comfortable for the head and braine, helping the memory, and warming and drying up the defluxions of rhoumaticke humours on those parts, for it is bet and dry in the fecond degree, a little aftringent and bitter, and of fubtill parts, it much conduceth to weake livers and fainting spirits, and strengtheneth also a languishing stomacke, helpeth disentries or laskes, and the

Although the fabject matter of this whole works is the description of Plants, and of no other things, yet I minke it materiall to this Classis and among the other Physicall Drogues, to treate of a few others that are not for decially fuch as are belt knowne.

CHAP. II.

Ambra Citrina, Yellow Amber.

Ellow Amber is called SALETON by the Greekes, Succinum by the Latines, and Carabe by the Arabians, and in the Apothecaries shops, and is of fundry colours, some peeces being whitish, some yellow, paler, or deeper, and fome of a very deepe red colour, and darke, all the other being cleere and transparent, but much more being polished: It is generally taken to be a kinde of liquid Birnamen, whose Springs and Fountaines are in the Germane Seas, and running into peeces, tome greated to the season of the season ter and leffer then others, and is taken up with iron hookes, being lost under water, bur hardring in the aire like Corall: that which is white, as being accounted the highter and tweeter is the beliffer and containing in the aire like Corall: that which is white, as being accounted the highter and tweeter is the beliffer and containing the pulled of the containing of the state of the containing of the state of the containing of th try red, and finelicth very fleree and flrong of the firthalmolf odious, yet by being fundry times re-diffilled, it bromm the forestifyed that both form and colour is to farre amended, that it is then fit to beinfed. The Physis all properties of Amber are many, fortising most rated hot and dry, being burned on quicke coales, the funces all properties of Amber are many, fortising most rated hot and dry, being burned on quicke coales, the funces received to the head, doe much helpe the moult dottillations thereof on the eyes, seeth, note, or from help, and is veyear enight for those thirther with filling dissensate; to lefter their fitz, and to reflore them: it is good to prowhe womens courful, and fingular good to helpe the firangling of the mother, and helpeth women will child,
but to goe, out their fall time with early and to his dir their milicarrying that are subject thereumes, so sale hale both to go cont their full time with calls and to hinder their militarrying that are subject thereuses, to take hade that may of the pontiarity a reason eggs or in Winnettee or four morning sogether, and this also helpsth them the have the twinters, and men elter have the government of the reises, confirmanch this also hengthning the parts very much, and help considers or manning of the reises, confirmanch which, and the confirmation of the reises, can fing it to avoid plontifully, being taken in Saxifrage water; it is also very good for old congless, and help that are faller into working prion; to take the pottless thereof mixed with Conferve of sed. Refer in the samings falling, and is very available for joyet attent when, and the maning gott. The Chimical collection is a little Muscal heads to wonderfully cale the thous; and the large large transport transport making in the droppers. two or three drops in the large large transport transport maning in the droppers. Two or three drops in the large large transport transport making in the droppers. Two or three drops in the large large transport transport making in the propers. information who momory, and is a fungular trains in all copicalicall difeates.

CHAP. III.

Amber grifes. Ambergrife.

Mbergriefe is better knowne to most by fight what fort is better then other, then what it is, or whereof it commeth: the opinions of Authours are very variable hereof, some supposing it to be the spawne of the Whale, others the recrement of long continuance in the belly of the true Whale (that hath no teeth and eateth foft fishes) which it casteth forth at certaine times, and by the agitation of the sea is cast on shore: some others take it to be the excrement of certaine great sea fishes, and some to be the some of the sea; all which opinions are utterly erronious, having no shew of truth in them: for although Amber in the Ethiopian language, lignifieth a Whale, as well as Ambergrife, and yellow Amber also, from whence rose that vulgar opinion of being the spawne of the Whale, or because that in the belly of a Whale (as Monardus relateth it) taken about the Ganary Illands, there was neere an hundred pound weight of Amber found, but in an hundred more taken afterwards, was none at all found; Yet the most likely and certaine received opinion of the most judicious is, that it is a kind of Bitumen (as the yellow Amber is before faid to be, and therefore have both one name of Amber, being so seere one to another in their originall) whose springes are in the Rockes of the Sea (or as some of the Auncients supposed grew on the Rockes, like Mushromes on trees) condensate into that forme and substance usually observed, having that cylinesse or unctionsnesse in, it from it owne originall, and being light is carryed by the waves of the fea, unto the shores of fundry Countries and climates : Iojua Ferrm relates the original thereof as of his owne knowledge, and that untill it hath attained the full maturity, it hath not that true fent of Amber, as after, and faith that he had seene divers such great peeces, that had not attain ned their true fent. And although the Ethiopian coalt, from Mozamlique and Sofala to the Islands of Mildiva and beyond them to the East, doe most abound with Ambergrise, yet are not the coasts of the West Indies in fundry places without it, nor yet these of Europe, in severall parts, and even our owne, and the fife coasts have yeelded it oftentimes, and in severall peeces and quantity, yet neither so much nor so great as in other Countries: for Garciat ab Orta faith, the greatest peece that ever he faw, was a peece of fifteene pound weight; but there hath beene seene se it is set downe by Authours, some peece well neere an hundred pound weight. For the choyse thereof, feeing there is much variety in the colour, and fome in the fubflance, as white mere or leffe, or gray lighter, or darker, or enclining to reducife or blackenesse: that which is not very white, as being usually very dry, but grayifh more or leffe, and either with spots and veines, or without, so as it be fat, that is, upon a knives point, or such like thing, heated will shew oylie, is accounted the best, having the peculier sent belonging thereto, which is most neere unto dry cow dung, in my opinion, the blacke fort is the worst. The properties of Ambergrife are thefe: it is hot and dry in the fecond degree, it warmeth, refolveth, and strengtheneth, what way soever it be taken: it easeth the paines in the head, being dissolved in a warme morrer, and mixed with a still optiment of Orenge flowers, the temples and forehead being annoyated therewith: it conforms also the braine, warmeth and resolveth the cold defluxions of humours thereon, and on the nerves and finewes: it doth likewise comfort and strengthen the memory, the vigour also and spirits of the heart, it is singular good for women troubled with the mother, to be applyed to the place, it helpeth barrennesse proceeding from a cold cause: it is conducible to Epilepticke persons, to smell often thereunto, which causeth their fits to be both lesse violent and permanent: it doth most conveniently agree with aged persons, to warme, comfort, and strengthen their cold decayed spirits, adding vigour and lustinesses them, and is accounted conducible to venereous actions.

CHAP. IV.

Amomum. Amomum.

Ven as I said before of Lignum Aloes, and in the last Classis of the true Ballamum, so much more may be said of Amenum, that the foregoing times for many ages had utterly lost the knowledge thereof, and is yet to this day held doubtfull, as the Ballamum is, with many learned men, both in other and our owne Country, whether the right be to be found in rerum natura or no, and therefore formerly many did obtrude divers things for it, as the Rosa Hieriennitina by some, and Pes columbium by others, which is a kind of Cranes bill, called Doves soote, both which errors Main

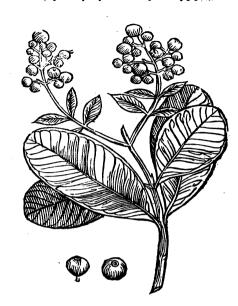

thiolous bath (ufficiently confuted, Quarranism also tookthe Myrim Brabantica our Gaule to be it, and then as Mathiolous faith, a small feed came to be taken for it, and therefore called Amonum Germanisms: but Garcius ab Orea, who lived many yeares in the East Indies, declareth that he saw a branch of Amonum, which the Physicions of Nitemaslaces, the King of Decan gave him, being brought as they said among other drogues out of Assay, and Arabias, for the Kings use, which as he saith, he found agreeable to Dioscorides his description there of, and withall was very like unto a Doves foote, and called Hamanum by the Arabians, which figuifieth the same thing, that is, a Boves foote; but both he and Naturanda Dowes were deceived with the same thing, brought from Orano, in being so taken there generally, so both the Amonum & Amonum are set forth in the sigures by Cinfum in his Scholia on the same place in Garcius and here also. All these opinions and every of them are unterly false, and no way answering the truth of the thing, and Dioscorides his descriptions for of late dayes there hath been fent to Vinice from the Bast Indies, by one Martinellus a famous and curious Italian, in the scarch of care drogues, the true Amondum, which although thath beene opposed by divers learned men, yet Alaronem of Padon, hash in a little treatise thereof, so exemplified at and commented upon every part of it, and companing Dioscorius with Piny together, that it is now generally accepted of almost every where to be the right and genuins thing, the description whereof, I means so much as was sent, is on this wife: I let a banch or cluster of which the one dever such as the such or cluster of which the one was sent, is on this wife: I let a banch or cluster of which he round berries, some than the sum of Carbes for the one ward forme and bigness, burelse very like unto Cardanoness within, yet big ger and rounder, having within the outer whits the things she let or skinne, sindry blackish browne seeds cole

Amomum genutuum & /purium.

2. Anomam aliud quoranam & Gayophyllam Pl.nij Elujio fufticatum. Another forc of bastard or falle Amomum suspected by Clusius to be Pliny his Garyophyllan.

thrust together, very like to the inner seedes of Cardamomes, but larger and of somewhat a fiercer piersing sent, fmelling somewhat like unto oyle of spike, which made Clusius co thinks it had beene seasoned therewith, and of a sharpe hot and quicke taste. The properties whereof are these : It is heating, binding, and drying, procuring sleepe and rest, and easing paines in the head, being applyed to the forehead, it digetteth and discusseth inflammations and Impolthumes, and helpeth those that are flung by Scorpions : being used with Bassill, it helpeth gouty persons, and mervailously easeth the griping paines in the belly and bowels by reason of wind, to swallow three or foure of the feeds, and for the mother in women, taken in that manner, or made into a p. flary and fo ufed, or elle in a bath, it is convenient both for the liver and reines, and is an ingredient of chiefe account, in great Antidotes that are preservatives. The false or bastard Amomum, which as it is likely is the same that Garcias faith was held for true in the Indies, and which Clufim faith in his Annotations upon that Chapter of Amomum of Garcias, Valerandus Donres received from Ormus, is by him thus described. They were like the toppes of some bulles confifting of a number of finall branches, fo thicke fet with very small leaves that scarse any stalkes could be seene but leaves onely, somewhat like unto the stake with leaves of the sea Spurge, the ends of them so clokd that they did in lome fort resemble a flower or Rose, and the whole branches together, the foote of a feather forted Dove, from which likenesse it is probable arose the falsification, this had no singular good sent or taste to commend it. The very like hereunto faith Clufius he received at Vienna in Auftria from Conftantinople, Which they there used for Amongue

a. Amomum alind quorundam & Garyophyllon Plini aClusio suspicatum.

Another fort of baltard or falle Amomum suspected by Clusiu to be Pliny his Garyop yllon.

Another for of pattary of raise 2-mommm, and to fent to our Drugifts, I thinke good to adjoyne it therewish, for some resemblance of the whole branch, although Clusus fetteth it with the Cloves, adjoyne it therewish, for some resemblance of the whole branch, although Clusus fetteth it with the Cloves, which as he saith it is formewhat like in sent, but I thinke hereferreth it to the Cloves, the for Pliny his name of Garyaphyllon, for in my sent and taste, it hath little affinity the rewith, but yet hath some correspondence with Pliny his briefe notes or desciption thereof, and therefore I will give you Clusus his figure and description. Is the same of Amomum, and I thinke are the same with his, are browner and bigger tones (but those that I have by the name of Amomum, and I thinke are the same with his, are browner and bigger all for the most part, then any Pepper graine,) some bigger and lesser, used and browne, and easie to be broken, which had blacke round seedes within them, to be divided into two parts, smelling as well as tasting like Cloves: this fruite or berries grow many clustring together like a bunch of Grapes, (each whereof hatha little cowne at the head, somewhat like an Hawthorne berry) two or three sometimes together on a stalke: this had likewise some leaves skill shiding on the branch, and were of sundry sizes, although all of one forme, that is some have not knowne it used for any disease, more then that being obtraded for Amomum, some more audatious then have not knowne it used for any disease, more then that being obtraded for Amomum, some more audatious then have not knowne it used for any disease, more then that being obtraded for Amomum, some more audatious then have not knowne it used for any disease, more then that being obtraded for Amomum, some more audatious then have not knowne it used for any disease, more then that being obtraded for Amomum, some more audatious then

TRIBEIT.

CHA P.7.

wife, have put in their compositions instead of the right, but by the taste as Clusius also noteth it, it might seeme to be availeable to many good uses if they were tryed.

CHAP. V.

Anacardia. Anacardes or Malacca Beanes.

Nacardium is a fruite like unto an heart, growing on trees plentifully in Cananor and Caleent, Cambaya and Decan, as Garcias laith, (and as some say on those mountaines in Sicilia that cast forth fire, but I somewhat doubt thereof) greater then our greatest Beane, and called by the Portugals Fava de Malac. qua, of the Arabians Balador, and of the Indians Bibo, whole outer skin or huske is of a darke red colour, Anacardi. Anacardes or Malagea beanes.

betweene which and the white edible kernell, lyeth a certaine liquour or viscous substance, of a fiery red colour while it is fresh, and of a sweetish, but somewhat hot talte, which is the true Mel Anacardinum, but instead thereof, because we cannot have them so fresh, that we might take torth this substance, some use to boyle the fruite being broken or bruiled in honey, and then call it Mel Anacardinum, but of farre leffe effect. The whole fruite faith Garcias, is familiarly eaten while they are fresh, as also being pickleed like Ollives, in all those parts where they grow, but as he faith, when they are dry, they use them as a causticke, to take away wens, &c. The qualities hereof are set downe by Serapio and Avicen, who although they make it to be of a delitery and poyloning property, by overheating and burning h blood, being hot and dry in the third,

if not in the fourth degree, which Garcias beleeveth not; yet they fay that the fruite helpeth the sences that are weake, and the memory that is decayed, and comforteth the braine, and nerves that are fibject to the palife that commeth through cold: Garcian faith that in India they use to give the whey wherein the fruite hath beene steen ped to those that are short winded, and to those that have the wormes.

CHAP, VI.

Cajous. The Cajous or Apple Beane.

Ecause this fruite comming from Brasil and called by the people there Cajous, is in divers things like unto the Anacardes, I thought it not amisse to give you the knowledge thereof next thereunto, with the description of it as Cluster hath

recorded in his Scholia, on the Anacardes in Garcias, for I finde fome other Authours to have made mention of it, as Christophorma Costa, Lugdunensis, Linschoten; Baptista Ferrarius who set forth a small plane thereof of one yeares growth, yet none have added any thing unto him. This tree (faith he) is great, having leaves like the Peare tree, but rather like Bay leaves in those that are new sprung up, thicke and of a pale greene colour: the flower is white like to the Orenge flower, but thicker with leaves, but not fo fweet as they, the fruite is like unto a Goole egge, both for forme and greatnes, of a very yellow colour, & sweet, full of a liquour like unto that of a Citron, that is called Lima, which is eaten by them with great delight, yet somewhat sharpe, and Acostasaith the same, and as it encreaseth the nnt groweth lesse, (although Thevet in the 61. Chapter of his description of America. contraryeth this manifest truth) not having any seed within it, but at the end of this fruite groweth forth this nut, which being put into the ground doth spring up like the stones or kernells or any other fruite, being of the fashion of an Hares kidney, of an ash-colour fometimes declining to rednesse: this nut hath a double rinde, or shell betweene which is a certaine spongy fubliance, full of a most tharpe and burning oyle, the kernell within being as sweet as a Pistack nut, covered with a thin ash coloured skin, which is to be taken away, and is faid to be a stirrer up of Venerious actions. and therefore

Cajou arbor cum suo & tenella planta,

used by them, being first lightly toasted: the sharpe liquour or oyle is used by them against scabbes, and is good alfo for running tetters, and ringwormes. I have here given you the figure of the nut it felfe, and of the first vertes shooting of the tree, as Baptista Ferrarius hath exhibited it in his Booke destarum cultura. Acosta further sith, that they use in the Indies to pickle them as they doe Ollives, and eate them to procure an appetite, to stay callings, and to helpe the weakenesse of the stomacke.

CHAP. VII.

Anisum exoticum Phillipinarum Insularum. A strange Anissede like seede of the Indies. ME can give you no knowledge of either roote leafe stalke, or flowers of this strange plant, brought from

King Phillips I flands neere unto China, and thereupon called Phillippinas) but of and thereupon cancular the toppes onely, with the huskes and the toppes onely, with the huskes and the Candillo, in feed in them, brought by Sir Thomas Candish, in his voyage of the Globes circum-navigation, and given to Master Morgan, Queene Elizabeths Apothecary, and to Master James Garret, of whom Classes received them, and giveth this description thereof. It was a stalke with flat umbels of feed. as large as those of Archangelica, and peradventure larger, sustained by thicke footestalkes, and set round at the toppe, in a round forme one by another, confliting of fixe, eight, or more huskes of feed, which were not parted in two like our ordinary Anissede, but each of them had divers round fmooth thining ath-coloured feed within them, like unto Orebus, the huskes were about an inch broad of a brownish colour on the outside and rugged, openning at the toppe into two equal parts, and although divers were empty, yet some contained such feed as aforefaid, the fmell and talte of them was very like unto Anisseed, whereupon it was called Anise by them that fent it : but Master Garret fent the right name, whereby it was called in the Islands, one of them being brought along with them, who fet the name in China Characters, which as Clubse faith he could not imitate, but was Damor, every letter being written under the other downewards.

CHAP. VIII.

Afa dulcis & fatida. Affafetida and the other Afa.

Lthough I have spoken somewhat of Asa duleis sive oderata & Assatida in the Chapter of Laserpitium among the umbelliferous plants, yet because I said but little of them there, reserving them for this place, I will here entreate of them more largely. There is none of the ancient Authours either Greeke, Latine, or Arabian, that hath made any mention of As, either dulcie or fatida, but was first depraved by the Druggists and Apothecaries in forraigne parts, that in stead of Laser said As, from whence ever since the name of Afe hath continued, and afterwards divided into Dulcie er odorate, and fetide, from the differing forts of goodnesse purenesse and sent thereof, when as they are both of a strong smell, yet one much more then another, the Asa feeda being of so evill a sent, that the Germanes call it Tensfella drech, that is, diaboli sterem, Devils durt, and is very neere the fent of Storax liquida, if it be not the same, relented and brought into a liquid forme, the foote or fediment declaring it plainely, and is accounted with them to be fweet, being of a ftrong unpleasant favour, rather then sweet to us, fo is the Afadulca & odorata, called sweete in comparison of the other, called ferida, because being purer, it hath a more unpleasant sent and taste. For as Garcias saith Asa is called Alibe by the Arabiant, which is the Lafer of the Greekes and Latines, as the plant being called by them Anjuden, and Suphium by the Greekes and Latines, but Imgu and Imgara by the Indians, the one when it is clenfed and purified from the droffe being cleere and yellow as Amber, the other foule and impure, and are fo familiarly eaten, as Garcias faith by the Indians, in their meates, brothes, and fallets, and medicines, that they fearle eate any thing, that is not feafoned therewith, and is very pleasant to them being used unto it, but loathsome to others, the richer fort using the purer, and the poore the course : divers heretofore have miltaken Benzoin for Ma dulen, and I doubt the errour is not yet quite extinguished, and Matthiolus confesseth his former errour therein, which upon better consideration he amended, Benzoin being the gumme of a tree, and being not so hot as Lafer, which by Galen his appointment had for its libstitute Euphorbians being growne old. The Afa daka being in former

CHAP. 9

times well knowne and uled, is now adayes quite lolt and forgotten, being not brought into these parts, but the Affafeiida hath a continuall residence and recourse unto us, and is as Garcias saith, the true and onely Lase, Associated hath a continual rendence and tecomic unions, and far they care one of Laserpitiam of the ancients, and so accepted generally by the Arabians in India, and say they erre mightily or Laferpitism of the ancients, and to accept generally of the rifing of the mother in women, as all frong that make them differing. It is generally used in our dayes for the rifing of the mother in women, as all frong and evill fented things be, which depresse it, and is singular good to be put into hollow aking teeth, to ease and and evill fented things be, which depreted in a substant and a cold time of the years, and after a little walking he found himselfe possessed with a gentle sweate, both head, armes, and body, and shortly after found his stomacke better disposed to his dinner then at other times before, and digesting it better. Garcias faith the Indians use in to take away the loathing of the stomacke to meate, and to strengthen the weakenesse of it also, and is much u. to take away the loathing of the itomacke to meate, and to itrengthen the weakeneite of it also, and is much used by them to provoke unto Venery, and cauleth one to expell winde mightily, which thing was tryed by a Portugall as Garcias relateth it upon an Horse, whom the King of Bisnager would have bought, but that he was over subject to breake winde, but after that the Portugal had cured him thereof the King bought him, and asking how he cuted him, he answered him with Affafetida given in his provender, no mervaile faid the King, if he were cured with the gods meate, yea rather with she devils faid the Portugall, but foftly, and in his owne language for feare of being overheard.

CHAP. IX.

Balfamum Peruvianum, The West Indian Balfamums.

F the true Balfamum I have entreated in the last foregoing Classis or Tribe, but there have been divers other forts of liquours called Balfamum for their excellent vertues, brought out of the West Indies, every one of which for a time, after their first bringing were of great account with all men and bought at great prices, but as greater store was brought, so did the prices diminish, and the use decay, when as it was the same thing and of the same vertue it formerly was, such is the inconstant course of the world in all things. One fort of Balfamam which is of most frequent with us, is called blacke or browne Balfamam, because the colour is

blackish, and tending to browne being dropped forth, which as Monardus faith is gathered from a tree, somewhat bigger then a Pomegarnet tree, (whole fruite or long pod I here shew you, as I received it, with a very browne almost blacke colour, and finelt fo like this Balfamum or Benzoin, that I am cerrainely perswaded it was gathered from this tree) not by incision, as the juyces, liquours, and gummes of other trees (which yet this tree doth also in small quantity, yetheling white, and so precious with the Indians, that they will not part with any of it) but made after the manner that the Indiansule to draw forth the juyces and liquours out of all their other trees, which is by cutting the branches, and the bodies also sometimes of trees into small peece, which after the boyling in a great quantity of water, the oyle swimming on the toppe, after it is cold is scummed of by them and reserved. This is of a thicke, yet running consistence, and of a sharpe and somewhat bitter talte, but of an excellent fine sent, comming necrest unto Benzoin, but will not long enduro, being rubbed on any thing that is kept in the ayre, but never loseth it sent being kept close in a glasse or the like. This is used inwardly and outwardly for divers good uses, and although in some it causeth a kinde of losthing to the stomacke, if it touch the tongue, in drinking foure or five droppes in wine falling, yet it helpeeth the weakenesse of the stomacke, the Tissicke, and shortnesse of breath, thole that are pursie and the paines and difficulty in making water, it moveth also womens courses, and causeth a good colour, and a sweete breath, rectificth the evill disposition of the liver, openeth obstructions, and preferveth youthfullnesse even in aged persons that have much used it, and helpeth the barrennesse in women: being outwardly used, it is singular good to heale any fresh or greene wound, and old ulcers, and sores also: it easeth

paines in the head or necke, and swelling in any part of the body, the places thereof being announced therewith, or a cloth wet therein and applyed: it helpeth digeltion, firengthemeth the ftomacke, diffolveth winde, eafeth the spleene, and the Sciatica, the Grangury and Rone, and discusseth all nodes and hardnesse of tumours, being applyed warme to the places pained: it warmeth and comforteth the finewes, and keepeth them from firinking!

Another white and very cleere Ballame of a very fweet fent Monardus faith, was brought likewise from the continent of America in some good quantity, which was taken by incition from very great trees full of branches to the bottome, whose outer barke is thicke like Corke, under which there is a thinner, from whence being flit the Balfamum droppeth forth, the fruite hereof is very small even no bigger then a Peafe, and of shitter talle, inclosed in the end of a long things white cod, where with the Indians doe smooke their heads against the paines thereof, and the unaricke defillations: This liquout or Bullamann is accounted of much more verue then the former, one droppe being faid to be of more force and effect then a great deale of the other. There is another fort of precious Balfattum faith Montredus brought from Tola, which is a Province betweene Carthas gena and Nombre de Dist, and is gathered by incition from mail low trees, like unto low Pines full of tranches, but with the leaves of the Carol rice abiding greene alwayer; the manured yeelding more liquour then the wild, and is of great account with the Indians and Spaniard, being tingth by them: It is of a gold red colour of amiddle confidence and very clammy or glutinous, of a fweete and pleasant talks, not provoking vomit, as other forts of Balfamum will doe, and of an excellent fent like unto a Lemmon, whereof a droppe being let fall into the

CHAP. XIII.

Bitumen Iudaicum. Dry Pitch of India.

He Bitumen or dry Pitch, which the dead Sea in Indea casteth up ar a certaine time of the yeare is sec downe by Diose ides to be of a shining purple colour, but that which is blacke, is adulterate, and Mattholim saith that the Ashalum, or Bitamen of the short of Indea is but a mixture, and not the true thing: Dioserides saith it is had from Phénicia (wher of Indea is but a part) from Babylon, the Island Zacynthus and Sydon: but that of Babylon which hath beene seene by many in these dayes, is held to be another thing, even the same that the builders of Babylon used instead of morter to dement their bricks; but that of the dead Sea is only in use and the best, which dead Sea or Lake is of a great extent, yet diversly proportioned by Writers thereof, for Pliny as I find Matthiolus quoteth him, maketh it to be an hundred miles long, and tioned by Writers thereof, for Pluy as I find Matinoidia quotetti nim, maketer it to be an unique in less over, but Sir Walter Ralegh in his Chronicle, relateth Pluy to make it less then our Moderne Travailers doe, who judge it to be eighteene Dutch miles in length, that is 72. of ours, and two Dutch miles and a halfe in breadth, that is tenne of ours accounting one Dutch mile to be four English, Insephus faith it is 180. Furlongs in length, that is two and twenty and a halfe of our miles, and 150. Furlongs in breadth, that is eighteene miles and somewhat more of ours, such variety there is in Writers: This Lake or dead Sea is (called by Galen Lacus Asphalistes) the fame place where Sodome and Gomorrha with the other Cities flood, mentioned in Genefit, being then the pleafantest and most fruitefull valley of all those parts, exceeding Hierichogand the parts thereabouts, which is about fifteene miles from it, and whose River runneth into it, and odrowned therein, yet no fish entereth into it; but now the tract of ground about it for a great compasse bearetha sad face, and is either utterly barren and fruitelesse, or beareth such fruite as is onely faire without and dost within, and the aire noy some and pestilent, by the thicke infectious vapours arising from it, and is neither mowed by the wind, nor will suffer any thing to sinke therein, but will swimme on the toppe, and is not onely of a sale but bitter taske, which will corrupt any thing rather then preserve it, as salt \$ea water will. There are other fores of Bitumen in the World, as Hiltorians report, as in Cuba, and fundry Fountaines neere the fea shore, calting it forth as blacke as Pitch, Another fort is in a Province of Peru, where the place is voyd of tree or plant, and giveth a fat liquid Bitumen in this manner: Turfes of the earth, being laid on hurdles, the liquour dropping from them, by being fet in the Sunne, is kept to heate and comfort any place affected with cold humours and tumours, cureth wounds, and is used for those griefes whereunto Caranha, and Tacamahaca serve: it is of a strong smell, and of a blackish red colour. The Inhabitants about this Lake, gather this Bisumen or Pitch, being an oyle of liquid fubfrance on the water, and hardned by the aire, and fpend it chiefly in pitching their Ships, but medicinally it discusseth tumours, and swellings, and molles yeth the hardnesse of them, and keepeth them from inflammations, and is of fingular good ute for the rifing of the mother, and for the falling fickeneffe, to be burnt and the fumes thereof which are ftrong smelled unto? it bringeth downe womens courfes taken in Wine, with alittle Castoreum, it helpeth the biting of Serpents, the paines of the sides and the hippes, and dissolveth congealed blood in the stomacke and body.

Petroleum quali petra oleum or oyle of Peter, is athinne reddish liquour, thinner than oyle of Ollives, and atmost as thin as water, and is accounted to be a liquid Bitumen, and thought to be the Naphtha of Diescorides by Matthiolus, because it is so apt and easie to take fire, even by the ayre thereof, and is gotten in fundry places of Italy, diftilling of it felfe out of a Mine in the Earth, and in Hungary also, in a certaine place, where issuing forth in a well together with the water, the owner of the place thought to have the chinkes stopped up with morter, which could not be done without light, the workeman therefore taking a close lanthorne with a light mit, went about it, and being gone downe into the well to stoppe it, very suddainely, the Peter of eaking size shew round about the sides of the Well, and with a hideous noyse and smoke, like the cracke of a peece of great Ordinance shot of, it not onely cast forth the Workeman dead, but blew up the cover of the Well into the aire, and seron fire also some bottles of the oyle that stood by the Well, and many persons that stood thereby were fcorched with the same. This oyle of Peter is a speciall ingredient to make wilde fire, and is of a very hot and pietling fent and quality, and therefore is used for cold aches crampes and goures, and to heate any greene wound

or cut, studdainely, a little thereof being put into the oyle of Saint lohns wort and used.

CHAP. XIV.

Blatta Byzantia five Unguis odoratm. The swecte Indian sea fish shels?

His Indian shell, of some sea fish, hath beene the subject of some controversic among the learned s for Fuchsim would make the Onythe of Diescorider, and the Blatta Byzantia of Unguis ederatus, to be differing things, and then againe, he would make the Blatta Byzantiato hea bone in the mouth or fore part of the nofe of the field fifth Panpara, or purple Periwinkle, and this he doth rwise expresse in his Annotations on Nieholans Myrepsu, in the composition of Annea Alexandrina, and in Diamergariten, into both which compositions the Blatta Byzanpia are to be put, but Main Biolus concelteth against this his opinion, and faith that these sweete shells called Concoula Indica or Unquis odoratm are taken by Serapio and Avicen, and the latter Greeke writers, to be no other thing then the Blatta By-Miles And agains that never any Writer accounted that bone in the note of the fifth Parpura, to be sweete or

numbered among other sweete things, but that the ashes of their shells being burned was drying, and served to clense the teeth, and to restraine the excressences in the flesh, to clense ulcers, and to bring them to skinning : but on the contrary side, the Arabians have alwayes used the Blatte Byzantie; because they were of an aftringent

CHAP. XV.

Bolus Armenius Bolarmoniacke.

He severall sorts of Bole or Bolarmoniackê that are to be seene at fundry times with us, doe tellise that we caree know which to accept for the right, for Galen faith it is of a pale colour, and Pliny making three forts, red, and leffe red, and a middle fort, sheweth that both red and pale were fo called, and used alike, and most of the forts that we have, have the notes and markes of the true, that is, it is a firme or close earth, heavy without gravell or stone, and for the most part wholly of one

colour, without discoloured parts, which doth shew that not onely that Bolus Armenius which some call Orientalis, but many other of the finer forts, found in other places, not onely as a mine of it felfe, but in the mines chiefly of iron, and some in those both of gold, filver, and copper, may fafely be used for some of the same purpoles : but because they all or most of them doe colour the hands or fingers of them that touch them, many have supposed that it may not unfitly be referred to Galens Rubica Lemnia, which was differing from the Terra Lemnia, because it coloured the touchers hands, which Terra Lemnia did not : or may be the Rubrica Sinopica of Dioscorides, which was of a liver colour, although peradventure in his time the Alexipharmical qualities were not knowne to him or in his time; as his Rubrica Fabrilia, so called because Carpenters did use to firike their lines therewith, as we doe now with chalke, may be our common Bolarmoniacke, which is courfer, more brittle, and used onely outwardly to stanch bleedings. All the best force of Bole with us, have such a clammy or sticking quality, which the ancients mention not, that is, if it be touched with the tippe of the tongue, it will cleave very fast thereto, and the stronger it cleaveth, and the harder it commeth from the tongue, the better is the Bole accounted of. And is used as a speciall remedy in all contagious diseases of the pestilence, small poxe or the like, and in pestilent scavers, and against poytons, and the venome of Serpenta: it hath also a binding property to reftraine all fluxes of the belly or of the sperme, or of womens courses.

CHAP:

CHAP. XVI.

Borax. Boracc.

Orax or Borrax called by the Greekes Chryfocolla from the property of fodoring of gold; and Tincar, or Timal by the Arabians, is faid by Garcias to be a Minerall matter, gotten out of a Mine of earth, in a mountaine, about an hundred miles off from Cambayette, but this is not the Chryfocolla of the Auncients, Dioscorides, Galen, and Pliny, which in their times was of a greene colour, found in Mines of fundry mettals, made into pourher and washed often, and prepared for the purpose; but ours is made by many in our owne land as well as in others, by art as Allome is, into small pure white precess, of no take or but wal-

lowish; and is easily beaten into pouther; the substance whereof it is made, being brought us out of the East Indies, and no place else that I know, and is certaine white stones, put into, or wrapped in fat or greafe, which is called unrefined Borace, and so brought to us, untill it be refined, as we have it to use: the properties whereof befides the fodering of gold, filver, copper, &cc. is of good efficacy, not onely inwardly taken to binde fluxes of the belly, as laskes and the like, but the gonorrhea paffio, or running of the reines, but outwardly to foder up any cut or fresh wound in the flesh, and is often used also with other things as a facin for the face, &c.

CHAP, XVII.

Cambugio quibusdam Catharticum aureum. The golden yellow Indian purger.

His Cambugio as it is of late importation, fo it is likewise of small knowledge unto us, whereof it is made, for but onely what we see of it to be a solid peece of substance, made up into wreathes or roules, yellow both within and without, and giving a yellow colour upon the montening of it, we know not as yet, neither can we learne truely, whether it be a gum or hardned juyce, which it is the more likely to be of the two, because it will so easily dissolve in water, although some suppose

it to be the juyce of Emphorbium, others of the purging Thorne: some thinke it to be made of Scammony, or Tithymall, others of Spurge, and some of the greater Celandine, other of the middle rinde of the Aldar tree, and lastly Baubinus, because he would say somewhat, maketh a quid si force, what if it be not the juyce of the flowers of Ricinus dryed, and I say it is most likely to be the juyce of a peculiar herbe of that Country, that giveth such a yellow juyce as Aloes. It hathgained a number of names, partly from the fundry nations languages, and partly from the miltakings and ignorances of people: as Ghitta jamaa, or Gutta gemon, or Gama gitta, or Gutta gamandra, or Cattagamma, or Cambici, or Crambici or Cambugio, and fome others also, which I willingly omit; it is brought upreus out of the East Indies, and some say from China. The properties hereof are to purge both by stoole and by vomit, and is of much use with divers persons of good judgement and quality, who give from three or foure graines unto ten or twelve, or to a scruple or halfe a dramane, according to the age and strength of their bodyes, and worketh gently with some, evacuating forth crude fleguisticke humours from the itomacke, and wheyish from the bowels without any trouble: but contrarily with others it worketh very churlishly, and with much perturbation of the from acke : Some also use to make small pilles of st, and give it in that forme, especially if the humours be stiffe, and not easie to be avoyded, and for that sause some will adde a little Scammony unto it to helpe the flow working in some bodyes, some also to correct for the tenderer bodies will give it in the pulpe extracted from Currans in white Wine, as a corrector of the qualities, and fome in the infusion of Roses.

CHAP. XVIII.

Champhora. Camfire.

Amfire, called Capbura from the Arabians Cafar, is such a subtle thing, both in substance and nature, that although it is the gum or liquour of a great vast tree, (like to a Wallnut tree, whose wood g is somewhat solid and firme, and of an ashcolour like unto Beech, or somewhat blacker, the leaves are whitiff the unto Willow leaves, but neither flower nor fruite have beene observed, yet is likely to beare both) partly distilling forth of it owne accord, but chiefly by incision, which commeth forth cleare and white, and hath no spot therein, but what it acquireth from their foule hands that touch it, yet what we have and use, seemeth princip to be so made by art, being cast as it were or sublimed into broad round pannes or dishes, and little above the thickenesse of ones thumbe, cleere, white, and transparent, but not to be made into powther of it felfe, (although it is somewhat brittle, and will breake into many small peeces) without the helpe of a blanched Allmond, or forme other such like unchious thing, which hereby will reduce it into fine pouthers neither will itbe easily dissolved in cold water, but by warmth will be resolved line outo fat, being easily set on fire, and will burne in the water, ferving for wild fire with the other things, and it of a very frong fierce fent, both fent and substance vanishing away, if it be exposed for a while to the open aire; yet the wood being made into severall workes, will smell thereof a long time: Some take it to be hot, because it is of such tenuity of parts. Rhasis faith it is cold and moift, but Avicena faith it is cold and dry, and that it caufeth watchings and wakefullneffe, and quieteth the lenses of those that are hot, which are contrary one to the other, as Garcias, and Scaliger upon Garcias notethit. Camfire doth coole the heate of the liver and backe, and all hot in Hammations and diffempers of heate in any place of the body, eafing the paines in the head, and restraining fluxes, either of blood out of the head and nostrils, being applyed to the forehead with the juyce of Houseleeke or with Plantaine water, and some Nettle feed, or the fluxe of sperme in man or woman, using it to the reines or privy parts, and extinguisheth Venery, or the balk of the body: It is a preferver from puttefaction, and therefore is put into divers compositions and antidotes to relift venome, poylons, and infection of the plague or other diseases: it is good in wounds and ulcers to restraine the heate, and is of much use with women that desire to preserve their beauty, by adding a luster to the

CHAP. XIX.

Caranha. The Gumme Caranha.

Aranha, Caranna, or Caragna, is a gumme brought from the West Indies, whose tree is not described by any that have written of it, but is a fost kind of Gum, wrapped up in leaves that one peece should not sticke unto another, for it is very cleaving, and is of a darke or muddy greenish colour, having somewhat a sharpe piersing sent : but there is another fort as Monardus saith, that is as clette as

Christall, which I never faw: It is a most especiall and speedy helpe, when Tacamabaca could not as Monardus faith be had, for all cold aches, and paines in the nerves and joynts, and the fwellings and paines therin, the defluxions also of humours on them,or on the eyes,or on any other part to be laid on the temples or behind the eares; it is also used as Well as Tacamabaca for the toothach to be laid on the temples like Masticke.

CHAP, XX.

Cardamenum. Cardamomes.

Here hath beene formerly much controver sie concerning Cardamomes, whether we have either than of the Grecians, or those of the Arabians, some supposing we have neither, and that the Cardamomes we daily use, agree with neither of all their descriptions. Theophrastm, Diescorides and Galen, among the auncient Greekes, and Pliny among the Latines mentioning but one fort, and the Arabians two

sumptions, to rectifie the evill disposition of the liver, the inveterate paines in the head and stomacke, and streng benethit, and to dry up the defluxions of themmes, to helpe the jaundise and the burshings in children or others by deving up the humour, which is the cause thereof: it helpeth also the palsie, and all the other diseases of the by my and bladder, the gout and Sciatica, and the nodes also, and ulcers of the yard, and is good in all cold and melancholicke grisfes, some take it to be a great incendiary to lust: the manner of taking it is divers, for some boyle it being sucedthinne, and steeped for a good while in water onely, and some adde wine thereto, and some boyle it in the broth with a chicken, tyed up in a linnen cloath, and to take from a quarter to halfe an ounce of moreat a time, as the quantity of drinke or broth you will provide, or as the party can beare. We have had a kinde of roote brought us from the West Indies in forme somewhat like unto this true, but harder, redder, and Pfeudochine more knotty, which fome called bastard China, and was not used by any that I know, Monardus saith that the true was planted in the West Indies, and brought from thence very fresh into Spaine.

CHAP, XXIII.

Cinamomum, Canella & Cassia. Cinamon and Cassia.

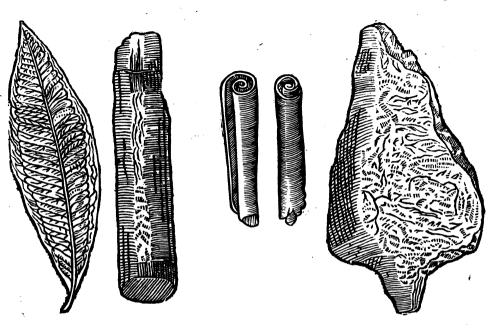

Know that divers learned men are of opinion that Cinamon, Canell, and Cassia are three distinct things, differing each from other, and that we have no true Cinamon brought to us (which controversie is too long to insert in this place) but that which weustrally have, is 28 they call it Canell or Cassia, and not Cinamon, yet Garcias sheweth that the Chinesse and Arabian Merchants, and others were the cause of this plurality of names given to one thing, and of the fables that are extant in Herodotus and others of it, and other things; and that the diversity of goodnesse, either thick-

nefie or blackneffe,or other outward forme,or quicke and fharpe talle,or dull and leffe fapid,or the place of growing made the feverall forts that passe under severall names, both now and heretofore with the ancient writers; for if one would becurious now to search among the great store of Cinamon, that commeth from the East Indies Pearely unto us, as Clustus and others have done, he might finde as much divertitie both in goodnesse and colour whe or any other did at one time or another : for being the barke of a tree, the goodnesse followeth usually, either the place of growth, one being better then another, or the oldnesse of the trees, the younger being the thinner and fill having the quicker tafte and the fresher colour, all the Arabians as Garcias saith doe generally call it, be it of what fort sever, Querfas, or Querfe (or Kerpha, which in Avicen is a worse fort, as Scaliger moteth, in Zeilan Cuarde, by the Persians Darsini, that is, the wood of Sina, which the Porsugalls first corruptly called China, and from thence is the name China used by all others : but whereas Garcias faith that the name of Ginawas given by those of Ormus that bought it of the Chineses, as though it were Chine Amomum. Scaliger in

rupt pronuntiation of the Poringalls, and what affinity faith he hath Amomum wih Cassia, Cinamomum being so ancient a word, that we finde it in fundry places in the Bible, by the Hebrewes named Kinnamon, as Exod. 20. 23. Cantic, 4.14. and Prov. 7.17. But herein I thinke Scaliger is too quicke and selfe conceited, for Garcias sayings notwithstanding may hold good, the Sinenses or Chineses, having beense anciently the greatest Merchants for those parts as Garcias sheweth. And although it were rare in Europe, at a thousand denarios (or drachmas, for I thinke them all one) for a pound as Pliny saith, and chiefely kept by Princes as part of their treasury, yet we read in the Scripture that the Ismaelites, Midisnites and others, were the Merchants of spicery for those parts, whereof Cinamon in those three places aforenamed was one no doubt. But Galen his description of the Cinamon tree (which was wholly brought in a cheft to Rome, of foure cubits and a halfe in length, having fome fixe or feven flemmes, more or leffe, riling from a roote with fundry branches thereon, whole youngest and tenderest, as he faith, were the quickeit and chiefest to be used, the longest of them being not above halfe a foote long, of a colour faith he, as if unto milke some blacke colour, and a little blew were mixed together) so differing as it may seeme from that we now so call, that it hath caused many to say, that the true Cinamon is utterly lost, even as Opobal Jamum and Amomum was thought to be, and peradventure all alike, for if it be granted that wee have Cassia, as many doe, then assuredly true Cinamon will not be farre to seeke, for Galen in the place before cited, in the end of the faid narration of Cinamon hath these words, Universa autem Cinamomi natura, similia est quodammodo optima Caffic, that is Cinamon is in some fort like unto Cassia: And therefore all that Aldinus hath said, Cisanoman A nofeeming to himselfe to have said something materiall, is little or nothing to any purpose. Monardus also in the

The Cinamon tree is described by Garcias to be as great as the Office tree or fomewhat leffe, with many straight branches without knots, covered with a double barke like the Corke, whose inner rinde is the Cinamon, and is so barked every third yeare, and being cut into long peeces, as if it were the bark of the whole tree, is cast on the ground, where in drying it is rouled together, as we see it, & is better or worfe, blacker or better coloured, as is faid before, or by the greater or leffer heat of the Sun, fomewhat more changed the leaves are of a fresh greene colour, and like unto those of the Citron tree (and not like the Flowerdeluce leafe, as some have fabulously written) or as Christophorus a Costa saith with three ribs, but Garcias disavoweth it: the flowers are white, and the fruite blacke and round like Hafell Nats or small Ollives, and not like Acornes, but the best groweth in Zeilan with leaves like Willowes rather then Bayes, with spreading branches and fruite like Bay berryes, whereof they make an oyle. Now concerning Cassia, whether it differ in genere or

his notes on him faith nothing could be more unfitly or foolishly spoken, for China as is shewed, is but the cor-

paie from Cinamon, called Canell in fome countryes refleth to be shewed : both Garcius, and Monardus speaking of the West Indian commodites in the arm Chapter of his Booke, say that the tree is but one that beareth both these forts, and that the variety of places maketh the difference one by but because Disolerand the other suncient Authouse have not onely made these as it were two kindes, but appointed them both to be put into one medicine, especially Mitbridatum, and Theniasa Andromachi, and in the holy annoyning oyle in Excellen, we will a little more exactly scan the matter, for although we finde that all the Cassia or Cassa lignes, that commeth mus or was formerly knowne is the barke of a tree, and either rouled together like Cinamon, or not rouled but in small or great smooth peeces, and therefore may well be perceived to be a fort of Cinamon, yet the taste being glutinous leffe tharpe and quicke, and more lightieke then Cinamon, argueth it to be the barke of another fort of tree, although of the same kinde, and peradventure may be that kinde whereof I entreated in the 64. Chapter of the last Classis of trees, which I there call Lawren Americana: And although that which we have alwayes uof the last Claim of thees, which I there can Language and although that which we have alwayes unfed come to us from the East Indies, yet that letteth not but that it may grow also in the West, And however both Virgill and Pliny call that herbe Cassia, which was sowne or planted in Gardens; as well for Garlands as to feed Bees with their flowers, as hath beene shewed before, yet they both doe mention a tree Cassia, Virgill secundo Georgicorum understandeth this tree Cassia, as it is likely in these words, Nec Cassa liquidic completes under Olivi. And Pliny 16, 12, 2.29. in shele words, Cassa that groweth where Chammon doth, is a shrab, at three cubirthigh, but on the hills whose thicke branches have their barke more like anto leather, which man be emptied or hollowed in a contrary manner, unto that of Cinamon, for being cut into flickes of two cubits long, they are lowed into fresh bealts skinnes, that the wormes may care out the wood, and leave the barke while, by reafon of the sharpenesse and bitternesses; the three forts of colour therein sheweth their goodnesse, that which is white for a foote high next to the ground is the worlt; the next thereunto for halfe a foote is reddiff, which is next in goodnesse, from thence upward which is blackish, and the best; and is to be chosen fresh, of a milde sent and of a very (harpe tafte rather then biting, of a purplift colour, light in weight, and with a fhort pipe, not easily broken : Thus farre Pliny, which for the most part he borroweth out of Theophrastus, lib. 9.c. 5. where he faith Cassa is a shrub, like the Salla Amerina, which because it is hard to be barked, men have invented the way by beafts skinnes, as is before faid out of Pliny: The barke being onely to be used, which I rather thinke to be a sable of report then truth: the rest that followeth in Pliny, is out of Theophrassus in his narration of Cinamon, where Theophrafts maketh five forts, the lowest the worst, because it had least barke, and the uppermest the thickeft as the best (which how likely it is that the barke of any shrub or tree, should be thinnest below, and thickest above, when as the contrary is alwayes seene in all sorts of trees, with us and others too I thinke) Galon in acknowledging Cinamon to be a tree with sundry branches, saith he hath observed not onely the branches of Cinamon to be converted, and very like those of Cassia, but those of Cassia also to be in all parts like Cinamon and that which bore the name of Zigi, was so like to Cinamon, that divers sold it for Cinamon, when it was but true Cassa. And againe saith that the Junior Andromachum mentioneth a kind of thicke grosse Cassa, which he called Caffa fiftula, because it was rouled together like a Pipe. And therefore Serapio, Avicen, and Melwes, in their compositions appointing Castin filiulato be used, which as Mathielus donbteth whether it were their owne or their transcribers fault, this Cassia is not to be taken, but that which hath hard canes, and a blacke pulpe, more fully termed Cassia folution or nigra, and which many yet doe use in stead hereof; but as Leovicenim faith, their errour is too great to be excused, that appoint the shels of that Cassia foliativa, to be used to move womens courfer to helpe their hard travels in childbirth, and to expell the fecondine or afterbirth. By all which that is now faid, you may see plainely that Cassia differeth not much from Cinamon, and yet that is differing from it. Lobel gi- xyloesswith us the figure of another fort of Caffia, which was as thick as ones thumb rugged & in take like unto the thick fa Lotely courser fort of Cinamon, Having thus shewed you the whole description of these things, and the various passages of them, let me allo give you the Vertues which are these. Cinamon is hot and dry in the second degree, of very fubric parts and very aromaticall, it is very cordiall, comforting the heart and strengthening a weake stomacke, eafing the paines of the winde chollicke, especially the distilled water of it, the stopping of the urine and womens abounding courfes, it caufeth a good colour in the face, and a good (weete breath, and resistent the poyson of venemous creatures, it is much used also in laskes to binde the body, the destilled water is most effectuall in all

I thinke it not amiffe in this place to make mention of some other barkes of trees and rootes, that have beene Gazella brought both out of the East and West Indies: The first whereof called white Cinamon, being in long toules, also, white both within and without, turned together like unto Cinamon, is thicke and more tough then Cinamon, the talte is somewhat hot, and resemble Cloves rather then Cinamon both in talte and sent, being very aromaticall, yet leffe in each quality, then Cloves, so that one would thinke he had smelt and talted weake

Another fort rouled like Ginamon, not very thicke, which the Dutch as Cluftus faid lib. Exot. 4. c. 2. brought An Caffic out of India, comming from the Moluccas and Iava, and which be doubteth whether it be not the Cassia of the vereum ancients, or some of the lorts whereof Diescondes maketh mention : some of it was whitish on the outside, and Glusio. some more browne, like the worser sort of Cinamon, of no unpleasant taste, yet not so sharpe as Cinamon, and having a little clamminesse in the chewing, the people use the pourher in their meates.

Another Classes maketh mention of in the same Booke and third Chapter, which was a foote long or more, Canella and three inches incircuite at the lower end, and two inches at the top, had the outer barke thinner, then the in- also ex ner, for it had two, and was very rugged, full of chinkes and with some holes, and sometimes two at a place in a arbote certaine order, all the length thereof but fet a thwart thereon, which seemed to be the places where the leaves grew, both the barkes were of an excellent sweete and aromaticall sent and quicke taste especially the outer-

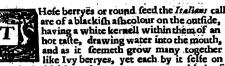

Monardus speaketh of a Canell of the new world, growing in Quito: the trees saith he that beareth this Cinamon are of a meane bigneffe and ever greene (as most of the Indian trees are) the leaves are like to those of the most orbit Bay tree, the fruite is like unto a little hat, as broad as a Doller, or Spanish peece of eight, and sometimes greater, the brimmes being of their thickeneffe, and both infide and outfide, of a darke purplish colour, smooth within and

these griefes, but the chymicall oyle thereof is much more hot and piersing.

rugged without, the toppe being higher, and had a stalke whereby it did hang; and was fastened to the tree, this fruit was in talte very like unto that of Cinamon, with some astriction joyned thereto, and the pouther of them streed on their viands, was used for Cinamon, the barke of the tree was thicke, and had no talte or smell of Cinamon, the fruite onely being of use, and good to comfort the heart and stomacke, dislove winde, mend a stinking treath, procureth a good colour in the face, and to provoke womens courses.

Coftw. Coftw.

H la ic ti

Hele hither parts of Asia minor, and Africa, besides all Europe as it is supposed for many ages of these later times, have wanted not onely the use, but the knowledge of the true Costum, of any of the three sorts, that Dioscorides mentioneth, especially Europe, and it was the Arabians that first brought in the devision thereof into sweete and bitter, when as neither Dioscorides nor Pliny make any men-

Coft no Indiem Clufi).

Coffi diversa species.
Divers forts of Coftes exhibited for Coftus:

tion of bitternesse, although Galen doth, but of sweetenesse in taste, none of them all but Allnarius onely, who is one of the later Greeke Writers: Garcias to excuse the Arabians, of this their division of Costus into dulmi and Amarus faith, that it might be that while the Coffus was fresh it is white, and hath no bitternesse in it, but growing old, it groweth blacke and gathereth some bitternessets it, by the decaying, but the Apothecaries shops, especially in Europe, shew two sorts, farre differing the one from the other, both in forme and subfrance. Of late dayes indeed they have beene more carefull and industrious to know the right, and to search for it and use it, the Portugal; therefore from the Indies brought in one fort, which as Garciae saith was onely used there and no other, but as Classes noteth it in his Scholis thereon, this being a ferulous spongy stalke, with the toppe onely of the roote to it, differeth from those of Dioscorides and Plins, the one intimating it to be aroote, by laying it was used to be adulterated or falsefyed by obtruding the rootes of Helemium Comagenium for it, which were neither very hot nor very sweete in sent, and Pliny saying plainely it is a roote: but there hath beene very lately brought unto us a fort of roote called Coftus, and taken by many to be the Syriacus, yet fome thinke it to be the Arabicus of Diofeorides, being somewhat yellowish on the outside, and white within, smelling and tasting fomewhat fweete like Orris, which therefore I judge cannot be right, which as Pliny faith is very hot in talte and very sweete in sent, and Galen giveth it such a degree of heate, besides the bitternesse, that it will exulcerate the skinne: many therefore have substituted Zedoaria in the want thereof, which is the best substitution that can be, agreeing both in forme and degree, most of all thereunto; and therefore divers have contended that it was the true Coffen, but in regard Zodowia hath more bitternesse and lesse sweetenesse therein, it cannot be Coffen, yet may be admitted as the substitute thereof, but omne simile non est idem: Some againe hold Angelica to be the blacke or Indian Coffee, but being a homebred plant foit cannot be, and besides hath no such bitternesse and sharpeneffe therein, as Galen giveth to Coftme. The Arabians call it Coft or Caft, those of Survat Uplot, and in Malacca where they much use it Pucho. The Vertues hereof as Dioscorides hath set them downe of the true Coffus, (which as is before aid is doubtfull whether we have or no) are these. It provoketh urine and womens courses, and helpeth the difeases of the mother, as well by bathing as fuming: two ounces thereof being drunke, helpeth the bitting of Vipers, and is good against the paines of the brest, convulsions, or the windy sitches, swellings or puffings in the fromacke, sides or body, being taken with wormewood in wine, and being taken with sweet wine it provoketh Venery, it killeth the broad wormes of the belly: it is used with oyle to annoynt the body, before the cold fit of agues to warme it and thereby to expell it, as also against the weakenesse of the sinewes, and the hip-goute, and amendeth the discolouring or blemishes of the skinne and face, using it with hony and water, and as Galen addeth by reason of the light bitternesse, and much sharpenesse and heate, it will exulcerate.

CHAP. XXVI.

Cubeba. Cubebs.

Vbebs are small berries somewhat sweete, no bigger then Pepper cornes, but more rugged or crested not so blacke nor solid, being either hollow or with a kernell within it, of a hot glowing talte, not fierce as Pepper, and having each a small short stalke at them like a taile, and therein very like to a kind of Pepper, was for a while wont to be brought to us, which the Portugals called Pimenta del rabo, Piper candatum, Pepper with a taile, and was sorbidden by the King of Portugall to be brought any more least it should spoyle the sale of the other Pepper: this saith Garciae groweth on trees

leffe then Apple trees, with leaves thereon narrower then those of Pepper running on trees like Ivy, or rather like Pepper, but not like unto Rusem, called Myrum sylvestring as Massibiolim Silvaticm thought, as Serapio set it downed but falsely: the flower is sweete, and the fruite growth clustring together, yet not in bunches as Grapes, but more separate. Casalpinum tooke them to be Amomum, many others out of Avicen and other Authours, tooke them to be

Cubeba. Cubebs;

the Carpefisms of Galen, and some to be the seed of Vitex, or Agama Cafem. The Arabians call them Quabebe, and the Carpefisms of Galen, and some to be the seed of Vitex, or Agama Cafem. The Arabians call them Quabebe, and Quabebe chini, but in Javas where they grow plentifully enough, and are there of so great account, that it is said, they boyle them in water before they part with them, fearing they might be sown and grow in some other place and use them much to stirre up Venery, and to warme and strengthen the stomacke overcome with slegme or wind, and doe purge the brest of thicke tough humours, helpe the spleene, dissolve wind and are very prostable for the cold griefes of the wombe: being long chewed with Masticke they draw much slegme and rheume from the bead, and strengthen the braine or memory.

CHAP. XXVII.

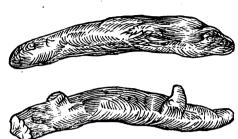

Curcama. Turmérické.

T is very likely that Turmericke is Disservides his Cyperm Indiem, which he faith hath a roote like Ginger, giving a yellow colour like Saffron, being bitter in tafte, and a prefent helpe to take away haire: all which notes agree notably hereunto, the roots being much like to Ginger then unto any haire: all which notes agree notably hereunto, the roots being much like to Ginger then unto any kindeof Cyperus, and therefore we may marveile the more why Disservides should referre it to Cyperus, unless he had understood of those that had seeme it, that it did grow like unto a Cyperus, and is very yellow both within and without, bitter in taste, and may serve for the haire, as it is specified, although grandy enture the force is halfe lost by the long carriage, but this is not the Garenna of Serapis of Avicen, as Managerial yellow both within and without the long carriage, but this is not the Garenna of Serapis of Avicen, as Managerial yellow.

this whath well noted, which is no other then the greater Celandine, whose roote is yellow, and therefore the Apothecaries in former times tooke it for Carcuma, and put it into the composition called Discurrence Garcias and Christophorus a Costa call it Crocus Indicus, and fay that the Indians call it Alad, and Manjalo, the A. rabians Habet and Curcum, the Turkes and Perfians, Saroth, and Darfard, that is liguum luteums ; it beareth lan-

ger and thinner leaves then Miller, of a paler greene colour, a stalke full of leaves, compassing one another to the toppe: the roote is flender and yellow, necre unto the forme of Ginger, nothing so bitter, being fresh by reason of the moillure in it, as when it is dry. It is of great use with many for the yellow jaundite, either the pouther or the decoction being taken, for it doth open the obstructions of the gall and other parts, it is of very gooduse in old and inveterate griefes and sickentsses. and an evill disposition of the body called Cachexia, and is very profitable against the dropsie: it is much used to colour divers small workes of wood instead of Saffrom the Indians use it much both to season and colour their meates and brothes, because it is to be had better cheape than Saffron, and as Garcias laith is put into those medicines are made for the eyes, and for the itch, if some juyce of Orrenges, and the oyle of the Cocar or Indian nut be mixed with it.

Carcuma: Turmericke-

CHAP. XXVIII.

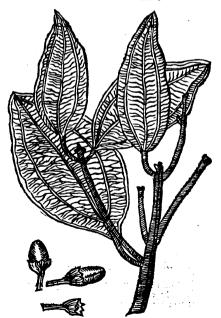

Folium Indum sive Malabathrum. Folium Indum or Indian leafe.

Hat Dioscorides and the other Auncient writers had divers false relations of drugges and other things brought unto them; which they have fet downe in their writings, may be well differned by this called Malabathrum, which they faid as they were informed, did grow in ponds and watery places fwimming thereon as the Lens palufria, Duckes meate doth: for it is well knowne now and fo fet downed by Garcias ab Orta, and other the later writers, that they are the leaves of a great tree growing on

land farre from waters in Cambaia, as well as in divers other places of the East Indies, and called Tamalanara by them, which by corruption was first changed into the Greekes rauanacades and then into Malabathrum but

by the Arabians Cadegi Indi, that is, Folium Indum, and are faire broad leaves with three ribbes onely in them, a little pointed at the ends, which have beene brought unto us, although very sparingly, and among them some yet abiding on their branches, two usually at a joynt talling iomewhat hot like unto Bay leaves, the barke of the branches also tasting like unto them; among these leaves likewife have beene found sometimes a small fruite like unto an Ackorne in the cup, which it is most probable is the fruite of the tree, and gathered with the leaves: but hath beene formerly supposed by some to be the fruite of the Cinamontree, and by others obtruded for Carpobalsamum: Some have taken these to be the leaves of the Clove tree, but they are therein much deceived, for they have not those three eminent ribs in them that these have. which is a note to diffinguish them from all other leaves almost, but some more probably have taken the leaves of the tree called Betre or Tembul to be folium Indam, because they have also some ribs in them, as Marcus Oddo doth in his examination of Theriaca Andromachi, but is also deceived, for the Folium Indum is not familiarly eaten as the Tembul or Betre leaves are: but whereas the substitute for these by our later Physitians appointment is the Maces which is the skinny covering of the inner fhell of the Nutmegge, I find that Avicen lib. 2. c. 359. appointeth Thalifafar to be taken, which he describeth in the same Booke, and 687. Chapter, and by the most judicious is the Macer of the ancient Greeks, which they knew better then Macie, which was utterly unknowne to them, but as if they were one and the fame thing, it hath beene generally to appointed, and is yet to taken to this day by most, but that Macer is not Macio : Pliny in his time sheweth plainely lib. 12. c. 8. saying Macer is the reddish barke of the roote of a great tree, called by the faid name, comming from India, but there would

need fewer substitutes by many in our medicines as well Mithridatum as others, if our Apothecaries would be most carefull and industrious to give instructions to the Merchants travailing into those parts, and our of those Authours that have Written of them to give the Arabian or Indian name, whereby they might get the genna ine drugg est for as Garcias laith there might easily be procured so much of this Fol. um Indum, as would serve all Europe if it were but fought after, and so I may say likewise for divers other things. The properties are to provoke urine powerfully, and is very beneficiall to the stomacke, warming and strengthening it, and maketh a weet breath, it resistent the force of venomes and poysons, and therefore is put into Antidotes and other compositions that are cordiall or stomachicall: it hath the properties of Nardan, but more effectuall being heated in Wine, it helpeth the inflammations and red nesse in the eyes being bathed therewith.

CHAP, XXIX.

Galanga major & minor. The greater and leffer Galanga

Here are two forts of Galanga a greater and a lesse: the greater is the weaker and duller in operation, and groweth in Iava and Malabar, to be two cubits high, having leaves foulding about the stalke at the lower end, being somewhat like a speares at the lower end, being somewhat like a speares head, of a fad greene colour on the upperfide, and paler above: the flower is white but without any fens, the feed is small and neglected: the roote is somewhat great at the head like the reed (but Classian taketh it to be more like unto a Flower de luce, then unto an Asphodill as Acoff a compareth it, and that the

plant may be a kind of Irw) of a blackish colour on the outside and whitish within, and use it familiarly in their meates as well as in their medicines: The leffer kind rifeth not above a foote high, having leaves like the Mirtle. the roote is small and bunched, firme and somewhat tough, red both within and without, and smelleth a little sweet or aromaticall, it groweth in China, where it is called Lavandou, the greater being called in Iava Lancuar ver both of them are usually so called: It is more commonly planted by the roote as Ginger is, then of the seed. yet is both of them are untainly to cancer. It is note controversic among the later writers, concerning Calamma, Acorm, and Galanga, for some have held opinion, and is yet continued by many, that the Galanga major, is the true Acorm of the Ancients, which is an errour easily consuted if they that so thinke would but compare the notes of A come given by Diofcorides with this Galanga: others deny our Calamus in the Apothecaries shope, to be the true corne given by Diofeoretes with this Gainaga: Others deny our Gainaga in the Apothecaries inops, to be the true Messay, which Matthiolus, Clufus and others have most evidently maintained, and as I have shewed before in the end of the sirk Classis of this Worke. Some also have set downe in their writings that Gainaga is the roote of Schangaribus, but I may say onarrasses, the content of the sirk Classic of the second indeed is to be used onely in all the compositions wherein Galanga is appointed, and is very profitably given to cold and weake stomackes, and in the griping paines of the belly by winde, the diseases of the mother, and stop-

> ping of urine, in which difeafe it hith a mervailous (peady operation, to elenfe the unitories from flimy flegme and ftones gathered in them, or the passages in the necke of the yard, as also to walks and consume away fielby excrefence in the necke of the bladder or yard : it also causeth a sweet breath, being sometimes chewed in the mouth and helpeth a cold most braine: it helpeth the trembling of the heart, and the wind chollicke.

CHAP. XXX.

Gummi Elemi. Gum Elemni.

His Gum being not mentioned with the former because we have not as yet attained the knowledge of the tree, from whence this Gum Elemmi is taken; I referved for this place : for although fome have taken it to be the liquour or gum that floweth out of the wild Ethiopian Ollive tree, yet it is most certaine it cannot be it, for it is said that the gum of the Ollives will not burne like Rossin, nor melt with the heate of fire, as the Gum Elemni will doe, which is a yellowish kinde of Gum, cleere

and transparent, which being broken sneweth more white and gummy within, quickely taking fire, and both burning and melting thereat, of a little quicke sent and taste. It is of especiall use in all wounds and fractures of the head and skull, to be mixed with the Balfames and syntments used for that purpose: it is also often used for the tooth ache, when the paines come by the defluxion of rheume into them, to lay a plainer thereof on the temples as they doe with Masticke.

CHAP. XXXI.

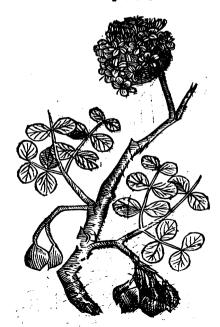

Guajacum five Ligum Santium, Ligum Vite.

He Lignom vite that groweth in some parts of the Indies, is much better then in others, yet is the wood of all hard firme, close and heavy, so that it will sucke in water more then Ebony and not swin, of an hot sharpe and resument tasks, somewhat burning in the throate: the blacker of browner is better then the yellow, being in a manner all heave, the yellow being as it were but the sape: The tree groweth great with a reasonable thickse gresnish gummy barke, spread with sundry arms and branches both great and small, and on them winged leaves set by every with sundry arms and branches both great and small, and on them winged leaves set by every sundry arms.

Guajacum five Ligunm faultum. Lienum Vite.

ples one against another, which are but small thicke, hard, and almost round, with divers voices in them. abiding ever greene on the branches: at the joynts and ends of the branches come forth many flowers, flanding in a tuft ever greens on a long footefulke confilling of fine whitish yellow leaves, not very great with some there is the middle, which afterwards turns into flar yellowish griftly fruite, of the fashion of the feed vessell of a Thinspire or Burga passoris, that is, with two divisions, and in the one side a hard griftly feed, as hard as an home almost, the other being for the most part empty, handing downs together by their long footestalkes: it yeeldeth forth also a gumme or Rossin, of a darke colour, which will easily burne; it growthe in fundry places of the West Indies, where they call it Gwayacan, and wee in Latine thereafter Gwayacan, but the light of Ebony, for the firme-scale and weightnesself, others a kind of Boxe. But as I have faid heretofore in fundry places of this Worke, most of the Trees and Herbes that grow in the Indies are differing from those that grow in Ewrope.

Gwayaco Occides smills arber. A West Indies are failed that grow in Europe.

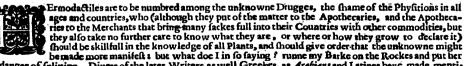

The branch of this tree I have here exhibited unto you, as Lobel hath fet it forth before, not having had the like brought fince his dayes that I know, which sheweth a more sipine neelingage in all our Sea men, then heretofore was usuall, which he hath described in this manner. The tree is great from whence this was taken, growing upright, whole barke was like unto that of the Industree: the greene leafe, of the forme of a Pomecitron lea'e, but thicke and imooth like unto the Bay, but larger and shorter, with sundry veines running therethrough, at the toppes of whose branches grow code, of a leather like substance, and round forme in a manner stat like a peece of mony, in whose middle is contained flattish seed, like unto a Lentill, both for colour and forme, and

Palum Santtum India Occidua. A differing Indian Guajacum. Lobel hath remembred this also in his Adversaria after this fashion: Divers have thought this to be a Palme like the last, or Palm Santhu, a stake of such a holy tree, which yet is differing from it or Guajacam, how forver it was so signified: for the tree is not very great like unto an Ash, but smaller, and the barke much like it in colour : the leaves were like Plaintaine leaves but thicker, fatter, finaller and fhorter : the fruite was of the bignesse of a Wallant, which served them to purge their bodies.

The difeases for which the usuall Gnajacam is appointed, that is both the wood, the barke and gum, are sundry, helping all cold flegmaticke and windy humours, and although they are good, and with effect used for Epilepfies or the falling ficknesse, catarrhes, theumes and cold destillations on the lungs, or other parts, coughes also and consumptions, the gout and all other joynt aches, and many other the like difeases, and to make the teeth white and firme, If they be often washed with the decoction thereof : yet was it first onely used for the French dileale, at we and the Spaniards call it, the Nexpelitane as the French call it, the Spanish pippe as the Ger. mens callit, but as it is indeed the Indian contagions for when Christophoras Colomas, commonly called Columbus, fift opened the Well Indies to the Spaniards, they companying with the Indian women, got this their familiar and naturall country disease from them, and brought it with them from Santo Donings, being the first place the Spaniards possessed there, unto the King of Spaines campe, which was then at Naples, treating of a peace with the French King, in Anno 1493, bringing of the Natives with them, both men and women: The Physicions in those times not knowing this disease or the causes thereof were of divers opinions, some raking it to proceed from the corrupt victailes that the fouldiers were forced to cate, which bred melancholicke and adult blood, and humours, others to the conjunction of Saturns and Mars, and thereupon (not knowing it to be a new discase) they called it by divers names, as the Leprofie, the running fcabbe, the poxe and the like, referring it to some of the ancient knowne diseases, but all in vaine : the cure hereof by this wood, first was knowne from whence it first forung: for a Spaniard being plagued with this disease, having an Indian that played the Leech, to be his servant, was cared thereof by drinking the decoction of the wood given him by the Indian, which care was presently divulged, not onely to the rest of the Spaniards in the Indies, but in Spaine also, and so confequently to the whole world.

CHAP. XXXII.

Hermodally/us, Hermodactiles.

is danger of fplining. Divers of the later Writers, as well Greekes, as Arabian and Latines have made menti-on of the Hermodactile. (although none of the Ancients) and have fet downe the properties, well knowne by experience unto them, but no one hath ever declared either the place or manner of the growing thereof, but onely Mefeus, who maketh a facw of description, which is almost as good as nothing, saying it is a roote of a mountime herbe, whereof fome are long like a finger, and are round, white both within and without, which every one may fee by the fight, but that any thould be long like a finger, is but rather his improficion from the name, then that he ever faw fuch indeed, and therefore divers have imagined diversly, fome taking them to be the rootes of Colebicany, but they are dangerous if not deadly, besides the unlike nesses in forme, colour and subtance: on theratake the Dest Casissan to be they, but they are more unlikely, for they are finished long, not thicke and thort, as the Hermodachiles are a belides the quality no way agreeth, therewith Marrhiolus first tooke the Orchio Strapius, called Palma Christi, the handed telticle to be they, because the word incoments fignifieth Hormes in the Hormes deligion. Hermes fingers, and these rootes being like the singers of ones hand, may well be so called, but CHAP. 23.

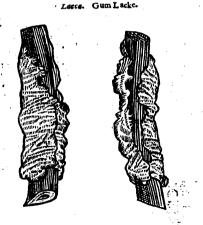

having himtelfe refused this errour, he fell into another as bad, taking Iris tuberofa, the Velvet Flower de luce to be Hermodaltiles, for the fame cause that the rootes thereof runne out like fingers, which are such filly opinions that he may justly be beaten with his ownerod, that is, be taxed as he doth others, that in referring Plants doe not examine and well perpend each part, rather then any one, before they determine of any thing a for Hermo. dactiles not with flanding the Etimology of the word, have no thew or likenesse of fingers, but are small and formewhat flat, thicke and short white rootes, yet some are blackish which are not good, of the fashion almost of an heart, as it is painted on the Cardes, of substance firme, yet soft and easie to be cut or made into pouther, and ot little or no taffe, but drying, Master Finch our London Merchant was here in deceived, by taking the kernells of the Tribulus agnations Water Caltroppe, for Hermodactiles as I thinke, as I have shewed you in that Chapter: Yet I would we might be better informed of the truth herein, that if any can finde that bigger fruite. growing in any of the ponds or waters in our Land or elsewhere, by breaking the wooddy shells of them, and comparing the kernells with our Hermodactiles in shops, that so thereby we be fully affured of the truth hereof, It is most effectuall in purging flegmaticke, sligny, and watery humours from the loynts, and therefore conduceth to helpe the gout and other running joynt aches, it is also of much use with other things for dyet drinkes, that are made of Guajacum, Sar/a and the like, and to very good purpose.

CHAP. XXXIII.

Lacca. Gum Lake.

Acce is no gumme distilling out of trees as other gummes doe, although it will melt with heat and burne with fire as they will, but is a certaine peculiar matter, elaborate and wrought by certaine great winged Ants that breed in the ground, and fucking our from unich they take the substance of what they that which is called Mala Indica, hereafter fer downe, from which they take the substance of what they work, about the smaller branches (as Bees doe their hony and hony combes) and make this Laces, which is a darke red (ubstance, somewhat transparent, somewhat like, but harder then any Gumme, which being chewed will make the spittle looke red, and is first wrought on stickes by the Natives of the Countries (the Ants Imeane) then melted being elected from the flickes, and the winges of the Ants, and made into cakes or thin peeces, which are to brought tous as well as on the flickes, and is the originall of the hard waxe, wherewith Letters are lealed by the helpe of a candle, whose colloures of red, greene, yellow or blacke, are added in the new melting of it againe, and making into such roules as we buy it to spend, but some to adulterate it, and make it cheaper, put usually waxe into it, which maketh it softer and runne quicker : it is called as Garciae faith by the Indians in

Pegn, and Martaban, where the best is made, Trec, but elsewhere generally by the Arabians, Persians, and Indians Loc, and Los Sumutri, as though it Were made in Sumatra, but that faith he is not fo, for it is but imported thither, and exported againe into other Countries. Great controversies are extant about this Lacca, whether it should be the Cancamum of Dioscorides or no for the name of Lacca was neither knowne to him, nor any of the Grecians or Latines, nor yet to Paulus Egineta, a later Greeke writer, or in the age wherein he lived, as Scaliger fetteth it downe in his notes upon Garcias, although Avicen and Serapio feeme to cite Paulus to be of that opinion : but Garcias faith that neither Avicen nor Serapio knew Lacca, because they make it to be like Myrrhe, and that it is fweete (as Dioscorides faith Cancamum is) and thereforeused as a persume, both which properties are wanting in Lacca, and further faith Avicen, that it hath tome properties of Carabe Amber, although unlike it in substance, and yet Carabe is knowne to be drying and binding, and Lacca is an opener of obstructions: And againe he faith that Lacca falleth from the aire, upon Service trees, when as neither any Service nor Medler trees grow in India as Garcias faith, and that it is the gumme of a tree growing in Arabia, and that it

is brought from Armenia, which things if they be true concerning Cancamum, they are not to for Lacca, for fo they say it is the Cancamum of Dioscorides, and from their opinions have the succeeding ages beene led to hold the same errour for the most part : for the Monkes that commented upon Mesnes, substituted Sanguio draconie for Cancamum, whom Matthiolus confuteth fufficiently: Some againe tooke Benzoin to be Cancamum, which is as erronious as any: Amateu Lustianus, and Garciae doe both agree, that the true Cancamum is the Gum Anene, called by some Anymum, especially that fort that is whitish and cleere, like unto white Amber, for there are three forts brought from Ginny, and those parts by the Portugal: The second fort is blackish, somewhat like unto Colophony, which Amatus taketh to be the Myrka Amines of Diescrides. The third fort is yellowish and dry like Rossin, but all smell sweet being burned, and are good against cold griefes. The Lacke or Laake, which is a colour for Painters, is made of Brassill or other dying stuffes, & hath in former times been put very ignorantly by some Apothecaries into the composition called Dialacca, but that error is well reformed since the true Lacca was brought and made knowne to them. Laces is hot in the second degree, it strengtheneth both the stomacke and liver, and freeth them from obstructions, and dissolveth the hardnesse of the Liver, helpeth the yellow jaundise and driveth forth the watery humours of the dropfie, provoketh urine and helpeth to breake the stone both in the kidneyes and bladder. Turners may herewith fet a firme and dainty red colour into their Workes, by holding it thereto in the turning.

CHAP. XXXIV.

Lapis Bezar. The Bezar Stone.

TR 1BB 17.

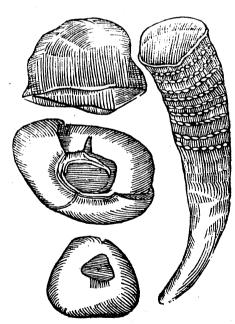

He Bezar stone that is now frequent with us, but not that minerall Bezar stone of Serapio, and the other Arabian, whose knowledge is now quite lost, is of so high esteeme, even next unto Vnicornes horne, and of so much and excellent use in Physicke that I could not leave it out from the number of tholeefpeciall drugges we have for use in our shoppes. There are two forts thereof to be had, the one brought from the East, the other from the West Indies, and knowne by the severall names of

their Countries: the East Indie Bezar is the best, both in estimation and use, and commeth to us in sundry formes, and of fundry fizes, for some are great, and those are for Princes and great persons, because they are not onely more rare to be found, but thought to be of the more efficacy, and therefore as Diamonds, Pearles, &c. the price of them rifeth according to their greatnesse, Garcias faith he had one weighing almost five drammes, as if it were rare to have one of that bignesse, but I have seene some that have weighed above sources, and some much more (but I am in doubt that they were counterfeit, and made so great by art, that they might be of the more esteeme, for I account the small ones or those of a meane size to be the truest and best, if any be) some are round, others long or somewhat flat, yet all of them for the m st part of one colour, that is of a darke ash-colour, or others long of total war and fine of the fining, (as if they were made out of one maffe of ftuffe and pollished) with fundry coates, scales or fouldes like Onions, some more, some lesse, according to the greatnesse of the stone, and the scales thicker or thinner also thereafter, having in some a straw or peece of haire wrapped close toge-ther, or a little pouther in the middle whereabouts the stone is formed, and is accounted the best and truest, others have small stones of fruites, or other things in the middle of them, which are not thought so good, but rather counterfeited, being of a firme substance being broken, I meane the scales: the best is gritty, and casse to be bruiled into pouther, and as some say dissolving in water, if it lye long therein (which I am in doubt is a signe of impositure) and is insipide without any taste at all. The West Indie Bezar

Lapis Bezar cam ungula & cornuario malis.

is likewise of divers formes, sizes, and colours, some having scales thicker or thinner, and fome none, with either pouther or peece of a roote, or some other thing in the middle of the stone. but is of nothing that account with us as the East Indian Bezar is, although some thinke they are taken from one kind of beaft, and as Iofna Ferrus faith in his Booke of fecrets, Printed in the Italian tongue, (on whose relations concerning these bealts, and the Bezar uken from them, Baptifta Cortefius, hath commented in his eighth decade Miscelaneorum medicinalium.) there are lix forts of thele bealts, in the West Indies in whom they breed, but that those onely are of most vertue that are taken from those beasts that live on the hils and mountaines, and feed on the more vertuall herbes there growing, and namely Contrayerva as the Spaniards call it, which maketh thestone to be the more effectuall (for as Forrus faith, some of the roote hath beene found in the middle of the flone,) they for the most part grow in the Plaines and Champion grounds: the beaft as Monardas describeth it, being but one of the fixe forts, is almost as bigge as a stagge, and of the like quicknesse and agility, but bodyed like a Goate, with hornes turned backewards (the figure whereof as Clufius was informed, he hath set forth with

The Bezar ftone with the hoofe and horne of the beaft.

the forme of an hoofe, as it is in his Scholia upon Garcias, and I here exhibite their formes unto you with the flones) and therefore the Natives call them mountaine Goates (ye shall have Ferral his fall relation of them all, manother worke hereafter) but more properly peradventure as Clufius faith, Rupi sapre Rocke Goates. (but Petrus de O sima in his Letter to Monardus describing that beast or Goate, which onely as he saith breedeth in the Mountaines of Pers, and in no other Countryes in those Indies beside, and out of which they gathered their Bezar Bezar, faid that they had no hornes) and are of a reddish browne colour for the most part, so swift of footether they were onely to be caught when they were killed or that with their Musquets, the stones grow as he faith there, in a certaine purse or skinne in the maw of the beast, wherein the wholesome herbes that they cate are received and kept, untill by rumination and chewing them anew, they passe them into their bodies, and faith moreover, that the stones that breede in the beasts that feed on the mountaines, are of much more vertue then of those that feed on the plaines: those of the East Indies as Garcias faith are had from Malacca, and divers other places, as well as Perfia, but none are like in goodnesse unto those that are brought from Perfia: The Moores he faith are so excellent in the knowledge of them, that by fight they can tell of what Country breeding they be. and whether they be counterfet or no, by crushing them in their hand a while, and then breath on them, and if any wind passe through them they pronounce them falle. The stone is called as Garcias saith Pasar by the Arabians and Persians from Pasar which signifieth a Goate, but we call it corruptly Bezar, and the Indians Bazar, (but Scaliger correcteth this errour in him, and sheweth that the Arabians unanimously call it Balzabar, theris Alexipharmacum, for they tooke the word from the Persian word Bedezahar, because it resisteth poyson, and we thereupon doe call all those things Bezardica that are resisters of poyson, as Antidotes and the like. But the ancient Arabians had a minerall Bezar of divers colours, which they celebrated to be of as great or greater effi-cacy then this stone, the true knowledge whereof as I thinke is either utterly lost, or as Monardus faith of his owne experience of no worth. This Bezar stone is not onely used against poylons and venomes, but against the pestilence, and contagious diseases, in malignant feavers also, and in many other diseases to provoke sweate, and thereby to expell evill vapours from the heart and vitall spirits, and for swounings, and against melancholly also. and the difeafes that rife from thence, and to preserve strength and youth, by taking it source or five dayes together, ten graines or leffe at a time, after the evacuation of the body: the pourher thereof put on the place that is bitten by any venemous creature, doth free them from danger of death, and likewife put into a plague forethat is opened, it doth the like, Monardus hath let downe many experiments of the Bezar Rone, upon fundry and feverall persons infected with fundry diseases, as who will may read them at length in that treatise which he wrote concerning this Bezar, and the herbe Scorfonera: but especially against poyton or venome, and citing the tellimony of Rabbi Moles Agyptus, faith, these three are by experience the most effectuall in the world therefore, that is the feed of the Citron fruite, the Smaradge or Emerald stone, and this Bezar stone. These testi-monies I thinke are sufficient to evince that opinion is held by many that there is no vertue, or at least no such vertue in the Bezar ftone as it is related, which they thinke by some tryall that they have made thereof, and not anfwering their expectation doth confirme them the more in that opinion : but if they have orderly proceeded, and heedfully observed not for one but many times, and in many perions, and have been sure of right and good stones. that they have given, and yet have done no good, I would rather fay there is some defect in the constitution of our bodies, by the moissure, &c. of our climate, then disable the verity of such reports of famous and worthy men.

CHAP. XXXV.

Liquid ambar. Liquid amber.

1590

Amm I nuid Amber is a thicke Roffinlike Gumme, dropping of it owne accord onely by incition from certaine huge great trees in the West Indies that are full of branches, covered with a thicke ashcoloured barke, having leaves like unto Ivy leaves, which gumme is of a very strong sweet sent, 19 somewhat like unto Storax liquida, and may well be used instead thereof, but there is another counter fort, made by boyling the branches, and scumming of the uppermost fatnesse that is gathered there, which is thought to be that Storax liquida, that is usually sold in the Druggists and

Apothecaries shops: out of the first fort while it is fresh and laid in the Sunne, there droppeth a certaine cleare reddish yellow oyle, cailed the oyle of Liquid Amber, and of some that know no other, Liquid Amber it selfe: which because it is the purer part is more effectuall and of the milder tent, some using it with other sweetes to perfume gloves withall, but is of fingular good use, either of it selfe or mixed with other things, to comfort and warme a cold moift braine, used like unto an oyntment, and easeth all paines and griefes that rile of a cold cause, being applyed thereto: it wonderfully comforteth and strengthneth a weake stomacke, helping digestion and procuring an appetite, but more effectually if it be mixed with some Sterax, and a little Muske, and Amber, and laid as a plaister to the itomacke: it likewise is profitable in all cold griefes of the mother, warming mollefying and diffolying all tumours, and opening the obstructions and the courses that are stopped, it is not almost in the third degree, and moist in the first.

CHAP. XXXVI.

Macer Gracorum. The Gracians Macer.

Any taking Macer to be Macie, and both one thing have erred egregiously for of Macer, Diefeerides, Galen, and Pliny, have written and shewed the faculties; but of Meen, which is one of the barkes or coverings of the fruite of the Nutmegge tree, they have not made any mention, being a thing utterly unknowne unto them, for if they had knowne it, they must needes have heard and knowne of the Nut or Nutmegge, whole covering it is; but Macer is as they all fay, a yellowish barke, which must needes be understood of some tree, Galen faith that Macer is of a cold

and earthly effence, and but little hot: but Macis is of much heate and no cold. And Pliny faith plainely that it is the barke of a great roote, and Avicen and Serapio, both knew the difference, and entreate of them distinctly in feverall Chapters, calling this Thatifofer. This Macer being called Macre by the Indians as Acofta faith, is a valle

and large spread tree, (the barke onely of whose rootes they use) greater then any Elme, whose leaves are fixe or feven inches long, and two inches broad, of a pale greene colour on the upperfide, and deeper greene on the unferen incides congrams two incides orosa, or a paie greene colour of the uperitor, and deeper greene on the in-define, beathing a finally ellow fruite no bigger then a penny, heart fathion, tafting like an Allmond or Peach genell, covered with a delible thin transparent kin like a bladder, close joyaed together, and growing out of the middle of a leafe, which is as bigge as the rest on the tree, but that it is a little rounder pointed, and nar-rower towards the stalke, being of a colour betweene red and yellow, and crumpled with divers weines therein, and like unto the bladders of the Elmetree leaves : every part of this tree giveth milke as the Mulberry tree doth, and hath very great and faire Ipread rootes like the Ilex or Evergreene Oke, covered with a thicke, rugged and and thanks of an afth colour on the outfide, and white within, full of milke while it is fresh, but turning yellow-is when it is dryed, very astringent and a little sharpe or biting withall, which vanisheth quickely it loveth to grow in most fandy grounds, and killeth all the herbes that would grow about it, and is found in Malabar weren, and forme de Santio Thome, and Murrayre. The barke of the roote is used much in all the Hospianers. ralls, and of great account with the Indians to cure laskes and fluxes of the belly, or blood, and give it either in pouther mixed with some sowre milke, or steeped in whey all night and taken in the morning, and sometimes if the needfull as Acol a faith, they put some Opium to it to make the medicine the stronger, and the Arabians put both Opium and Nutrategs to it and so cure them the said barke also stayeth vomitings or castings, and strengthneth the weake flomacke.

CHAP. XXXVII.

Manna granata & liquids. Manna in hard graines and liquid or thin.

Anna is of two fundry forts, the one hard and in peeces, either greater or leffer, the other liquid or thin like the thinner or at least lesse thicke hony, yet some have thought that the Manna thuris was that Manna that wasused in shops, but Monardus in one of his Epistles consuteth that errour, shewthat Manna that wasuled in shops, but Nannaman in one or this agent became so by the bruising and ing that it is but the small peeces and dust of the Thus or Observation, that became so by the bruising and mbbing of one peece against another in the carriage. Of the dryer or hard fort there is some diversity for that which is gathered in Arabia different from that in Persus, and called Transchibit, being in small graines somewhat like unto Coriander seed, and isgathered as Rannolsius saith, from those trees the Arabians call Agull or Albagi, Another fort is reddith and gathered from herbes and plants. That of Perfia is called Kircaft, that is, Lac arket rum, the milke of trees and is white like that of Calabria, whereof fome is as small as Hempeseed, others as big Persians. a Allmond Comfits, yet Garcias faith that the liquid fort is so called by them. Another fort is gathered in Armenia, in great lumpes as Rampolfin faith of a brownish colour. Another fort is affirmed by Aphrodifeus, cited by Armeniace. Niger, that falling as an honie dew on mount Libanus in Syria, is by the heat of the Sunne congealed into a hard Sugar which the Inhabitants call Sachar, from whence came the Latine word Sacharum. All these sorts are re- Syriaca. corded by fundry Authours, fome contrarying one another as is aforefaid, and might be much more amplyfied. if this place were fit for it, and therefore as I take it I have taken the truer reports: but whereas fome have thought that some of these smaller white forts might be the Manna of the Israelites wherewith they were fed, and therefore called bread, and that from heaven, yea Angels food, not that Angels feed thereon, but wr igos, per excellentimes, the choyself and chiefest, for forty yeares together in the wildernesse of Sinai and Arabia, it sheweth that such have had little conversation with the holy Scriptures, as a learning not fit for them to understand, whichis flat against such conceites divers wayes, First that this of theirs had no purging, but a nutritive quality: secondly it was not so Sugar sweete as ours in take: thirdly it fell not on certaine dayes, that is on their Sabbaths, although it did all the weeke after: fourthly it fell all the yeare long, and not the Summer onely as our Manna dothe fifthly it vanished away as soone as the Sunne grew hot upon it, but ours is condensate thereby fixthly it would patrefic if it were kept but two dayes except the Sabbath : And laftly as it is in Johna, the 5. Chapter, and 22. verfe. That Manna ceased to fall any more, after they had eaten the corne of the Land, which was the morrow after the Passeover, whereby you may see how vaine the conceites, and long altercations of men are, about those things whereof they are ignorant, or not sufficiently instructed: this is but obiter, and therefore to proceed. In Europe we have Manna, and called Calabrina, as being thought not to be found in any Country belides, but both Matthiolus and Bellonius, and some others also doe testifie there against, upon their owne fight and knowledge, as Matthiolus that in Goritenfi, and Tridentino agris, hee gathered it himfelfe and Beloniss in Brianfon, and others in other places, but there is a great controversie and contention amongst many learned mens first whether it be onely a dew ofheaven condensate by the cold of the night, or whether it be as agumme issuing from trees, being incised or wounded as other trees are that yeeld gummes: The Monckes that commented on Mefaes, and to likewife divers others were confident that it islued from wounded trees like gamme, and was no dew from heaven, for proofe whereof they alledge that the trees being overfpread or coveted with any cleath or the like, there would not be found in the morning that any dew had falue thereon, and yet the trees yeelded the Manna, which Marthiology thinking to disprove, faith it cannot found to reason or the course of nature, but rather that the matter happenerh in this fort, that the dewes falling on the dry barkes of those trees were drunke up by them, and was forced forth againe in small peeces like gumme in the heate of the yeare, not being the proper juyce of the trees, but what it had gained as aforefaid, and that this kinde of Manna was more loofe and foongy, and leffe operative then the other, and that this happeneth by the fectet and hidden Property in nature, especially of those trees to containe this dew in them in lumpes, and not to be liquid as on others all about them : A fecond controversie is whether Manna be gathered onely from the mannered or wilde Alborno, fome affirming it strongly, and others denying it as stoucky, as is before faid, that Massislas and Bellenisse doc declare : A third controversie is, whether it be onely poculiar to Calabria, and Apulia, or not; Which although some affirme for Calabria, yet ye heare as before, it is to be found in enemy other places. The Other fort that is liquid or thin, is gathered both in Afia and Europe alike, but that of the Levant is both more

plentifull, and more both usefull and operative, for although in many European Countries; and in our land like. wife a kind of honey or fweete dew hath beene found on trees and herbes in the heare of Summer, and in fone places so clammy, that the Mowers sithes cold hardly cut the grasse, for the clamminesse thereon, until the Sunne had beene some time thereon to consume it and dry it up. The arabians and others call it. Teremakin, and Trangibin, the Greekes as Galen faith someway & diejung, and Cordus thereafter Drofomely Pling callethin Melon are, or as others, Mel aereum, Mel roscidam, or as Hipocrates, Cedrium mel, and others Manua liquida, or as Matthi olus, Manna purgatoria: but a little to shew you my minde concerning these forts of Manne, that as the liquid for is both for substance and property alike, but that the European is not so plentifully to be gathered: So I verily thinke that the diversities in the other dryer, both for forme of greater or smaller peeces, or colour of white browne, or reddish, is rather from the climate and dispositions of the Heaven to be hotter or more temperate a but it seemeth to me very strange if true, that in Calabria onely the Fraxinist or Ornes should sweat out Manna, by lancing their barkes, when as in other countries both of Europe and Afia, it is gathered from fundry other trees, where no fort of Ashes grow, and that no Authour mentioneth any cutting of their parkes, to cause them yeeld Manna. You heare my opinion, whether true or falle, I leave to them that can verifie or disprove it, by proofe. and true judgement. The properties of both these forts of Manna are neere alike in purging, being of a meane temper, yet a little more enclining unto heate, or as Averrhoes faith, hot, and moift, for by their gentle working they may fafely be given to children, and women with child, and put with other purgers they helpe their working and evacuate choller: but because the grained Manna is both more frequent and more of use with us (the other being feldome feene or used) I will rather infift on the properties thereof which is that beside the purging quality, it quencheth thirst and doth lenific the hoarsenesse of the throate, and allay the sharpenesse of choller, and the nauseous humours in the stomacke : the often use thereof for those that are much given to be costive is very profitable, to be either taken alone or to be put inflead of Sugar into brothes, drinkes, or other things.

Theatrum Botanicum.

CHAP. XXXVIII.

Moschus. Muske.

Vske is a precious matter, and both is and hath beene of great worth and effeeme, not onely to perfumethings with, but for medicine to great good use: The beaft is deciphered out by some to be a kind of wild Goate, or Bucke Goate, that is, betweene a Bucke or Deere and a Goate, and therefore some call it Dorcas Moschi, others Gazella Indica, and some Capreolus Moschi, others make it to be like a Foxe, others like a Greyhound, and some a goodly reddish beast Gudderi, some agains say it breedeth onely in Golchanda, and some say in Pegu, a Country in the East Indies, and most store in the Country of the Tumbascanes, others say in China or Cathaya, others againe say none breede in China, but is brought thether from other places: It hath a big body, and two tuskes fay fome, others fay two above and two below, in the lower mandible of the jaw, Ricking forth like a Bore or Hogge, and without hornes fay some. This beast as it is faid by some, when it is in the heate of lust hath a certaine swelling rising thereby at the stomacke, the blood and matter gathering together, raiseth an Impostume or bile, which the beast defirous to be eated of, refusing means and drinke in the meane time untill it be ripe, doth then rub it selfe against the stones and stumpes of trees, whereby the Impostume breaking the matter congested sticketh on those thinges, which by the heate of the Sunne and temper of the climate is hardned, and all the ill fent (if it have any) confumed thereby, the perfect sweet fent remaining, and this is the best and choysest Muske is to be had, and gotten by great persons, chiefly to serve their use. Others report that every full Moone it hath neere the navell under the belly an empostume, or bladder full of blood, which the hunters after they have taken them, doe cut of and dry them in the fun, which becommeth the best Muskes. But there are other forts besides those that are more plentifully to be had and sold to the Merchants, gotten and made by art: for having hunted those wilde Goates and killed them, they cut them in peeces, press out the blood, and dry it, and sometimes putting a little of that purer Muske thereto, they put it up into small purses as it were made of the said beasts skin, and this is the usual Muske fold by these counterfeiters and false deceivers. Besides the greatuse of Muske, for all sorts of persumes, and to weare about one, it is very beneficiall to comfort the heart and fainting spirits, and taketh away the passions and trembling thereof, makethit merry and joyfull, and helpeth to expell fadnesse, it comforteth warmeth and refresheth the braine and senses, quickening the dullnesse thereof, and is a helpe unto Venery : it is put into many cordiall pouthers in our shops, and into many other compositions for the same purposes, as also for delight into many other things. It hath beene observed by some that the dung of a small beast, that is like a Weasell called a Marterne, smelleth somewhat like Muske. The semale Crocodile also hath a small bladder or skin about the maw, which smelleth foltrongly of Muske, that the waters wherein they breed, and are plentifull of them smelleth softrongly thereof, that few can abide to drinke thereof, and most doe refuse it therefore. There is also a kinde of great water-Rat that smelleth like Muske, &cc. But I referve the relation of the many wonderfull Worker of God in nature, to another Worke.

CHAP. XXXIX.

Mumme. Mumme.

Hat which is called Mumia, of Pomponius Mela, Condita corpora & Medicata funera, of Pliny, Servata corpora (being of much and excellent use in all Countries of Europe) is the very body of a man or woman; (brought chiefly from Egypt or Spris adjoyning, and no other part of the world so good) Embalmed after the manner was used in those Countries onely, (and not with Aloes, Myrthe, &c. as

being those things the lower and others used to embalme their dead bodies, nor yet with Piffalpalsbum, as it is likely other nations did) which was with Cedria and Nitar, that did fo confume the moisture of the carkale, and neserve it from putrefaction, that it was thereby made to endure entire and unconsumed for ever: for the Eintiant in former times being wonderfull ingenious, and of a most subtle knowledge in all humane wisedome. fasit is recorded of Mofes to be learned in all the wildome of the Egiptians, Alls. 7. 22.) milliking as it should weme the cultome of the Latines, which was to burne their dead bodies to afthes, and to preferve them in an nme : as also that of the Greekes to bury them whole in the ground : would to excell them take another way to metetve their bodier, (expecting a refurrection as it is thought) from either fire (which as they were taught by heir Phylosophers was a monitrous beaft, that devoured all things untill it was full, and then perished or dyed with that which it had devoured) or water, or earth that wormes should not consume them, and therefore with Nitar as with falt they preferved the carkafe from corrupting and stench, and with that Tarre, and Tarre water, called Cedria (which was made from the stickes of both the Cedars burnt, as is used to make Pitch, and Tarre, from Pine and Pitch tree (tickes with us) they befineared oftentimes the body all over, and wrapping them in many fouldes of linnen, which did to turne as it were, and confume by time all the moilture both of

flesh and bones, that it became wholly blacke, as if it had beene burned in the fire, and hard that it was not to be parted in funder without strokes and beating; but those things that were put into the belly of the dead bodie, could not preserve the whole body, and make every part blacke alike, as I thinke. All the dead bodies of Egipt, and Sysicalikewife being thus embalmed were they never fo poore, but with more sumpruousnesse and cost peradventure, of Aloes, Myrrhe, Saffron, Baliamum, and other precious things, if they were rich, or the Princes or kings & were carryed into a defart or barren place in Egyps, and laid with some monument or heape ofstones on them, which is the place where the Pyramides now stand (as it was the custome in all places to bury the dead in those places which were most barren, and not fit for husbandry, tillage, or pasture) and is about foure miles from Cairo, the River Nilm, or some branch thereof being betweene, which they must passe over either by bridg or boate, before they come there, and this as it is most likely, was the originall of the Greekes fables of Lethe, Stix, Charon, &c. The store of Mumia, that hath, and is yearely spent in all Countries.doth testifie the immumerable store of bodies buryed there fought for and brought from thence, which are all alike in fubstance, without any great or manifelt difference. There hath beene much controversie hereabouts, the Arabians taking Mumia to be Piffalphaltum, and so did Matthiolus also, Bralevel m to be Ashhaltum Indaicum, and to be used

instead thereof, which Marthieles misliketh, and seemeth to allow better of the Pifaphaltim, or the Aloes, Myrrhe &c. wherewith the bodies were stuffed, being altered in time by the moisture of the carkase in the grave, as is before faid then of the body it felfe, which is called Mamia, and therefore would have bodies to be so embalmed and kept, that theembalmings might be used, but assuredly, neither the one nor the other can be called Mumia rightly, nor are of that effect, for although Serapio and Avicen fay that Piffafphaltum and Mumia are all one, and therefore whatsoever property Dioscorides appointeth unto Pissahlum, the same they attribute unto Munnia, which was their errour, yet Galen and Paulin edicines, by saying that Pix liquida, is a fit substitute for Pissahlum doe intimate that it is of another quality then Munia is, and comment farre short thereof: It is not and dry in the second degree, and easeth the paines in the head, comming of cold and moisture, the Megrome swimmings, and falling ficknes taken in a decoction of Marjerome, & helpeth a cough taken in ptilane drinke, it is cordiall for the heart and preventeth the danger of poylon, or the venome of the Scorpion and other ferpents, dilfolveth winde both in the stoma.ke, spleene and bowels, stayeth the hickocke and bleedings, both inward and outward, dissolveth the congealed blood of bruises by fals or otherwise, and helpeth the ulcers of the bladder, and the retention of urine, being taken in Goates milke: it is also very profitably used against passies, crampes, and diftentions of the mouth, the hardnes and shrinking of the sinews, and lamenes in the feete through cold and wet,

CHAP. XL.

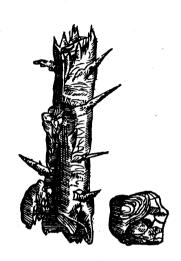

Myrrba. Myrrhe.

MACE Yerhe is the gam of a certaine tree growing in Arabia Ethiopia, and other places, as it is thought Theophrastine and Pliny declare the various reports of the face or shew it beareth, one contrary to another, so that it may be doubted whether any of them be true, seeing they be but guesses at the likelyest report. I have not heard or read, that any now adayes hath seeme the tree that beareth it. Diescorides faith that it is not malike to the Egiption Thorne, meaning Acacia, Without mentioning any report, and is got-V V V V V

ten by cutting or wounding the tree, that the gumme may flow forth, in the canicular dayes, as other gummes are gotten. We have many forts thereof, in good nesse some better or worse then others, as in great and small peeces, fat and dry, polverisentous like, pale and more red all alike, or else discoloured, with some whitsis precess in it, which is the best, for whereas Diosecorides commendeth that which is somewhat greene, I have not seene any such, nor read that any hath ever seene it, and it is very likely that the Greeke word with the most such Diosecorides useth, may be used pro colore pallescence, as well as subviridi, and so Rondelesius noteth it in his Chapter de Gobio pise, and to be taken here in the former sence. Myrrhe as I said before is in singlet so like unto Bdelium, that they are sooue mistaken by those that are not expert, but hath these notes and differences: it is extreame bitter; and so is not Bdelium, it is paler, satter, easier to be broken, and of a more quicke sharpe sent, so that the best Myrrhe, may be both knowne of it selse and hereby from Bdellium, that it is of a pusplish browne colour, in great peeces and fattish (for the greater peeces retaine their startessed smelleth somewhat sharpe and bixter withall. Divers have diversly thought of Myrihe, some supposing Myrrhe to be Benzoin, and Bdelium to be Myrrhe, and that we had no true Myrrhe, of little sharpes need.

Myrrhe and no true Rdellium because (a little sharpes need.

Mirrhe and no true Bdellium, because so little that was good. was formerly brought to be used, that they might be plainely distinguished, and the rather because that Galen faith Myrrhe, will be fornetimes changed into Opocalpajum, which is venemous and deadly, and is fo like it, that as he faith in his time many were killed therewith, who yet finding it to be very effectuall for fundry dileases of the eyes, thought it might be as effectuall for inward dileases: the notes of which Opecalpafum (as Galen calleth it or Opecarpafum the juyce of Carpasum as Dioscorides calleth it in his fixth Book and 13. Chapter among the venemous plants, but maketh no description thereof in any of his former Bookes) as I finde them fet down in Weckers Antidotarie in the examination of Myrthe) are these: because saith Wecker true Opocalpasium is not usually to be seene to compare it with Myrrhe, yet if you shall perceive in Myrrhe some peeces to be much differ ing both in sent and talle from true Myrr he, you may wel & not without good reason judge that it is changed into Opecalpasum, for although both in colour and substance it be like to the best Myrrhe, with whitish veines therein like unto the nailes of ones hand, yet examining it more thoroughly, it will be found not to be Myrrhe, and that there will likewife fome readificleere fpots appeare therein: it behoveth therefore to be cautelous in the choyse of Myrrhe, that you be not deceived with the thew or likenesse, but observe that it have all the true notes of true Myrrhe, least while you thinke you have the true Myrrhe, you have this poylon, is it be inwardly taken, which confumeth the corrupt mattering and watering of the eyes to beused outwardly: which metamorphosis (if it betrue, or

that Galbanum should be changed into Sagapenum or Cassia into Cinamon were very miraculous yet herein the old Authours are very frequent, but I thinke of these miracles, which are the conversions of substances, as I doe of their transmigration of foules) Diofcorides maketh no mention of it, but saith that the juyce of Carpajum (whether herbe or tree) was venemous as Tram, Cienta, and many other was, and to be cured with the fame remedies that Cicuta was, Dioscorides saith that out of the sattest Myrrhe called Pediasimos, being pressed is taken Statle; yet Pliny saith that the trees doe sweate out Statle, of their owne accord before they be cut, which is accounted to be the Styrax liquida of our shoppes, both by the Arabians and other later writers as Matthiolm saith, himselfe also being of that opinion, whereof I cannot but mervaile that he or any other duely considering our Styrax liquida, both the forme and fent fo farre differing from Mirrhe, should thinke it to be pressed out of fat Myrrhe, being of 6 fine a thorpe bitter aromatical fent, and the Styrax liquida, rather loathlome then pleafant. Dieforids maketh mention of one fort of Myrrhe called Aminnea, which Galen calleth Minea (Matthiobus taking them to be divers, and not one fort of Myrrhe) which some thinke to be the Gumme Anime, called by the Portugalle Gum Anijmum, comming from Ethicpia, for there is another of the West Indies whereof I shall intreate hereaston, but herein I thinke they are deceived. Galen faith that Myrrhe is hot and dry in the fecond degree, and therefore is good for wounds in the head: and by the bitternesse which is not little, it killeth the wormes in the belly, and the living childe, expelling the dead : it bath in it also a binding quality, whereby being mingled with eye me-dicines it helpeth ulcers and great scarres, and for the same cause is good to be put among those things are good for an old cough and shortnesse of breath, the bitternesse not harming the winde pipe or throate, but gently clenting and heating, it helpeth the roughnesse of the winde pipe or throate, saith Dioscorides, and those that are hoarse, and have lost their tongue as we call it: it is good also against the paines of the sides, the laske and bloody flix, and rheumaticke destillations; it speedily procureth womens courses and mollifye. h the hardnesse of the matrix; it also taketh away the shivering fits of agues, being taken two houres before it come: but Matthiolas faith that by taking a dramme of Myrrhe in Muscadine, using it three times, an houre before his fits, he was cured of a quartaine ague, but he did therewithall prefently after the taking thereof (west moderately in his bed:pilles like wife faith he made with it and Treakle, is effectuall for the fame purpose, to take one at a time as bigge as a peafe, an houre before the fits for many dayes together : it is also a great prefervative in the Plague or peltilence, and against the venome or poylon of Serpents and harmefull creatures, and therefore is put into Antidotes and counter poyfons: it is a fingular remedy for a flinking breath, falteneth toofe teeth, and

hyerh the shedding of the haire, being used with Ladanam, and the wine of Mirtles, it helpeth mattering eares and watering eyes, and taketh away the filme or skinne that beginneth to grow over and darken the fight, it helpeth to breede flesh in deepe wounds, and to cover naked bones, Mathielus commendeth it as a lingular form for the face to take away wrinckles that come by age, and to make it smooth and youthfull to be made into an oyle as it is called, or rather the liquour of Myrrhe, which is made with egges boyled hard, cut in the middle, the yolkes taken for thand filled up with pouther of Myrrhe, then put into a glasse and set in a Wine celler or moist place, and with this liquour to be bedewed: As also another way, that is, by sprinckling withwhite wine, a new ion dish or pan made hot in the fire, and taking first the sumes thereof unto the sate, being covered over with a doth, and then the sumes of Myrrhe in pouther, afterwards cast on it being heated againe, and the head covered subspore, and this still to be used before bed time, for eight dayes together.

CHAP, XLI.

Nardus Indica sive Spica Nardi. Spicknard.

Arcias ab Orta, intreating of this Spikenard tellifieth that there is but one fort knowne, and used as well by the Indian and Turkish, as the Perfirm and Arabian Physitions, and although some would intimate that this is not that was used by the Ancients, in that Pliny setteth it downe lib 12. 6. 12. that it was not to be had but at an excessive price, yet that hindereth not, in regard both all the Countryes of the Indies are better husbanded then herecore, and especially that since the Portingalls.

had opened the way by Sea, all forts of Drugges were provided better and better cheape by much, the charge of Caravans, being excellive chargeable by their long journey and travaile, but I thinke both the Drugges and the Indies, by being more fought by Venetians and other Christians was the beginning of the reformations, for when

Arabians and the like were the chiefe Merchants, much bad Merchandize was dearely fold, howfoever cheapely bought, and I thinke much more adulterated both by them and Iewes, and the Indians alsowere not behind to sophisticate whatsoever they could, which the Christians I verily suppose did somewhat alter, when they became great Merchants for Europe, and fince is rectified more and more, when onely the fincere and pure is bought, and the other left on their hand to mend if they can, but yet it falleth out that the blinde eateth many a flye, I meane the ignorant is often deluded, who through covetousnesse oftentimes letteth passe the better to take the worfer at cheaper rates : but to the purpofe in hand. This Spicknard groweth not in many places, and where it doth, it is not very plentifull; it is a roote yet called a Spike, because it shooteth up hairy stalkes of hairy like Spikes, many fet together, of a brownish colout, and whereas Dioscorides faith the roote is of nouse, yee must understand the word in a double sense: the rootes that Dioscorides meant, be the short fibres, whereby it draweth its nourishment and encrease from the earth, and these indeed be unprofitable and of no use; but the rootes that Galen speaketh of, are the Spikes themselves or Spicknard, for fo he calleth themboth, lib. 1. De Antidoti, thus laying; Inbet Andremachus aducere N ardum Indiradix enime et, sed quod spica formam referat. And in lib 9. de comp, med. sec. locos. He useth some what neere the same words : but in that some object, it is not of a fweet fent, fuch as Diofcorides recordeth of it, Garcias faith while it is fresh it is iweete, but time may decay some part of the sent, and besides iweete smells were otherwise taken with the Aunci-

Mardus Indica. Spicknard.

iweete imells were otherwite taken with the Aunciscients then with us, withesse many things, as Galbanum Allium, &c. were reckoned sweete, much differing cients then with us, withesse many things, as Galbanum Allium, &c. were reckoned sweete, much differing from the opinions now received, but thus I have shewed you the acception of the roote and Spike of this Nardus from the opinions now received, but thus I have shewed you the acception of the roote and Spike of this Nardus and the sweetesse is that I done hear a stake and leaves, yet have not mentioned what flowers it hath, neither is the other bastard or French Spikenard of Lobel shewed to have not mentioned what flowers it hath, neither is the other bastard or French Spikenard of Lobel shewed to have now, which I have exhibited in the sight school this work, but the like was so up in the roote also answering to Tradesent the younger, with such she to green leaves as is desciphered in that, the roote also answering to Tradesent the younger, with such she roote also answering to necessary the younger, with such that I could perceive, and necessary the roote of the stakes, but of a pale blackish colour, and without any seat that I could perceive, and besides all this, he found it with the spike of slowers and feed at the toppes of the stakes, which were turning or besides all this, he found it with the spike of showers and feed at the toppes of the stakes, which were cruming or the same should be such as the same in the turning) unto the Serve-winding, the sead stakes of small bright brownish chasses the great Turky Carlicke with a twinted head, constituting all on one side three rowes of small bright brownish chasses have as it were at their eads, and standing all on one side three rowes of small bright brownish chasses have as it were at their eads, and standing all on one side the stakes, for source or sive inches long.

This bastard was a state of the roote and spike of the stakes of the stakes of the stakes of the same stakes as a stake of the same stakes

this Indian kinde to have also some other, whether the like or no is not to be determined but by sight. The properties of this Indian Spikenard are these: It is of an heating and drying quality, provoking urine, and staying laskes, and both the reds and whites in Women: it taketh away the loathing to meate, and the gnawing of the stonacke usually called the heart-burning, it conduces the helpe to swellings, to the stone in the kidneyes, and to the Kings Evill: the decoction helpeth the inflammations of the mother if they six therein: it helpeth to bring haire on the baire eyelids: it is not onely an ingredient into the two famous Antidotes, Theriaca Andromachi, and Mi. thridatium, but into sendry other compositions appointed by the Ancients, but because I would not make a double repetition of the same things, having declared the properties hereof at large in the 4a. Chapter of the sixth.

CHAP. XLII.

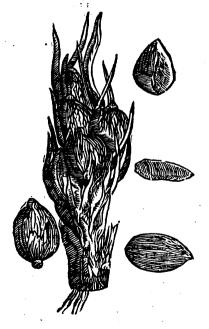

1. Palma five Nux Indicavulgar in ferens Coccos, The ordinary Indian Cokar Nut.

Here cannot be found in the world, a tree that hath so many necessary commodities for mensuses to be had from it, as this Cokar Nut: the tree groweth to be huge great and valte, whose body or stem is covered with a smooth barke, bare or naked without any branch to a great height (for which cause the Indians doe either bore holes therein at certaine distances, and knocke strong pegs intothem which sticke out so much as may serve for footing to get up into the tree, to gather the juyce or liquour and the fruite, or fastem ropes with nayles round about the tree at spaces which serve as steppes to goe up into it) and toward the top spread fundry great armes which bowe themselves almost round, with large leaves on them like the Date tree but greater, whose middle ribbe is very great, abiding alwayes greene, and with fruite alfo; continually one succeeding another: from betweene the lower boughes come forth smaller stalkes hanging downe, bearing fundry flowers on them like unto those of the Chesinat tree : after which succeed large great three square fruite or nuts, ten or twelve, or sometimes twenty thereon together, as big as ones head, or as a small Pompion almost round, but a little smaller at theend, covered with a hard tough darke ash-coloured barke, and within it an hard round wooddy brownish shell, but blacke being polished, having at the head or toppethereof three holes, somewhat resembling the nose and eyes of a Monckey, betweene which outer barke and this shell, grow a number of groffe threds or haires, or fach like stuffe, whereof is made cordage, stronger and more durable in the falt Sea, then any made of hempe; within the wooddy shell, there is a white kernell, cleaving close to the infide thereof, of the thickenesse of ones finger or thumbe, or thinner, as sweete and pleasant as an Almond while it is fresh, having in the middle thereof a pint, two or three, of cleare dainty sweet water, as pleasant as milke,

Palma vet Nux Indica Cocos ferens. The Indian Cokar Nut tree.

but as it groweth either to be over ripe, or being kept to be older, so much less pleasant will this liquour be, and either grow sower or thicke by time, and be quite spent and consumed, it hath beene observed that sometimes there will be floting in this liquour a small lampe or ball, as cleere as a pearle, and very sweet in tatte, which is such sprout, which have sprung forth a stalke rising through one of the holes at the head, and rising two palmes above it hath shor sorth shores for rootes. The name and uses whereunto this tree, and the fruite, and those things that are made thereof serve, are these, the tree it selfe is called generally by the Indians Maro, in Malaca Trican: but in Malabar Tengamaran, by Avicen Giansi al bend, which is Nux Indica, by Serapio and Rhasis, as Garcius saith, Isrelance, yet that word is not found saith Clussus in our Bookes, but Nangilithe Latines call it Palma Indica & Coccifera, to distinguish it som the Palma D allysisera, the timber whereof is not spongy or like the Fernla as Garcius saith, but solide and stime, blacke and shining like the W allnut tree, fit for building of houses or ships; and other things, as Garcius himselfe saith a little after, this tree saith

Garcias is of two forts (or rather as I thinke kept for two uses) the one to beare fruite, the other to extract the liquour issuing thereous, when the branches are cut, or when it is bored and received into Gourdes, or other such like things tyed thereto, which liquour they call Sara, and is like troubled Wine in shew, but in taste like new or sweete wine which being boyled is called Orraqua, and being de-

Nucula Indica alter.

A little Indian Nut, and another called

Mebenbethem.

filled is made like unto Aqua vice, which they use to the same purpose that we doe ours, and will burne like it, and is called Fula; and being fer into the Sunne will become good vinegar, but that which runneth last being suffered to abide in the Sanne untill it grow hard, or boyled to the hardnesse will be Sugar, which they call Iagra, The branches faith Garcias (but Ferdinandus Lopes faith the leaves) we called Olla, and ferve as umbrels to keepe of Sunne and Raine, and in such like leaves, faith he, was written the first Letter that the King of Caleens sent to Emanuel King of Portugall, upon the Portugals first arrivall into his Country, they serve likewise to cover houses, to be defended from raine, the fruite is called by the Indians generally Navel, which is common both with the Persians and Arabians, but in Malabar Tenga, and while it is greene and not ripe Eleni, the Portugals call it Coque, that is a Monckey, of the likenes of a Monkeys face, and from thence hath riten the word Coem or rather Coque, which the three holes represent, and at Goa Lanha, of the hairy stuffe or hardes which is next the outer barke of this Nur, called by the Indians Caire, are made not only Cordage and Tackle for ships, but cawking stuffe, which is better to cawke ships then any other stuffe, and being beaten, the finer stuffe is made into girdles and tawles for women. (sailes cloathes allo, but not any fine stuffe or cloath like any fine linsen) both of the meaner tawles for women. and better fort at Listbone, as Clusius saith he saw and observed, but as Garcias saith, while this Nut is young it buth a tender barke which may be eaten, and tasteth like an Artichoke; of the browne hard inner shell, being pollifted and made blacke and fhining, is not onely made cups, to drinke in, fet in filver or other mettall, which made Sepalveds to draw the Portagalls to thinke that it doth helpe those that have the Palsie to drinke our of them, but Garcias faith it hath no likelihood : but being burned into coales serve the Gold smithes for their uses: who goe about in the streetes crying for worke, and carrying some necessary tooles for the purpose with them; of the inner white kernell, which is hollow, cleaving fall to the inlide of the hard wooddy shell, which is an inch or two or leffe thicke, firme and falt catting fweet like an Allmond, they make bread especially while it is fresh, for the fresher the Nuts are, the sweeter will the meate thereof be, and doth nourish much, being good for macilear bodies, and to encreale sperme and Venery, and is good to lenefie the harshnesse of the throate; and the hoarsenesse of

together

TRIB'S 17.

Cocem de Maldres. The Cockar Nut of Maldres.

the voyce, and eaten oftentimes with Iagra before recited, or with Sugar, or elfe being broken and briffled they the voyce, and caten oftendmen with any or before the boyle Rice, and is as sweet as the milke of kine. or Goates, or else herewith, and the flesh of beatts or birds, they make certaine meates, which they call Carib. or Goates, or elle herewith, and the held of beatts of blids, they had been alled by them Copya, and in the fresh kernels being broken and dryed after the outer rinde is pared away, are called by them Copya, and is The tresh kernels being proken and dryed after the outer time is pared arry; after the copy, and is sent as a merchandise into other Countryes, that have either none or not fufficient force to serve their use: which tent as a merchanome into orner Country satural have orner none of not institute the parts, it is used also as a flirrer up of Venery, and to ensemble from feed: Out of this Copra or broken kernells is made two forts of oyle, the one pressed forth (after the same manner that oyle of Allmonds is made) and is a most cleare oyle in good a one prefied forth. (accer the tame manner that oyle or Allmonds is made) and is a lifet scale oyle in good abundance, which ferveth not doely to burne in Lampes, but to put to their boy led Rice: the other is made by putting warms water to them after they are broken to peeces and boyled, by femming off the oyle that wimmethabove the water, after they are preffed together, which oyle is afed as a gentle purgation to evacuate the bowels, some pur thereunto the pulpe of Tamarindes, which maketh it a little tarrer, and fitter for hot and chollericke bedien; the other oyle ferveth to mollefie the hardnesse and shrinking of the finewes, and old paines in the ferricke bedies; the other oyle terreth to montene the hardnene and intunking of the interves, and one paines in the joynts and for efficient after he is annointed, into a great and capatious tub or veffeil being heated, the may hold him, and therein fuffer him to abide for a good while, untill he have flept therein, and this bring edition a great deale of eate and comfort: but whereas wices faith, that it killeth wormes, Garand this bring editions are great deale and comfort: but whereas which that it killeth wormes, Garand this bring editions are great deale and comfort: but whereas the capation are the second and the state of eater and comfort in the state of eater and eater a cias faith he had ne treedie maither thought it probable, because it is well knowne, that the eating thereof ingendreth wormes, in all the Fourbinants that eate much thereof, and is a difease incident unto them: and where, as Serapio faith, by the authority of Mesues, that by the eating of these Nuts, the loosenesse of the belly is stayed it disagreeth not with reason, if the he, that the Nut it selfe, which hath much earthy parts in it, should binde the body, and the oyle which is of many thinne and aerions parts should loosen it; in the middle or hollow part of this kernell is contained, as is before faid, a great quantity of cleere fweet liquout, pleafant to drinke, and not bringing any offence to the stomacke, but rather refresheth the spirits, the other fort of these trees are reserved faith Garcias, that the head sprout or top thereof is taken to be esten, which tasteth more pleasantly then either tender Chesnuts, or the head of the wild or dwarfe Date tree, called Palmito, and by the Italians Cefaplini: The older the tree is, the pleasanter is this head, but when it is taken away, the tree dyeth, so that he may well be faid to devoure the whole tree, that hath eaten one of these heads.

Nuclea Indica racemofa. A small Indian Coker Nut many growing together.

This small Indian Nut which Cussus described singly, in the second Booke of his Exoticker, the six and twentyeth Chapter, and 54 page, and the second Nut was afterward sent unto him from Mounsteur de Peirses, in Province, but came a while after his death. The tree that beareth these fruites is in great account with the Natives where it groweth for with the leaves they make their drinke, being boyled with water, and of the kernels of the fruites they make their bread, that is sweet and pleasant, which truite groweth in a tust or spike, many together, and all upon a great thicke stalke, they are inclosed in a certaine hairy huske or skinne, breaking open upon the ripening, and each one also hath a hairy huske or covering; under which was another shell or covering, not much unlike to a Filberd, being an inch long, and an incit or better in compasse, being firme and solid, not having any loose or broken kernell within it, whereby to make any noise, but a sime white kernell sit to be eaten, which inner shell had an oylinesse about it, like unto oyle of Allmonds.

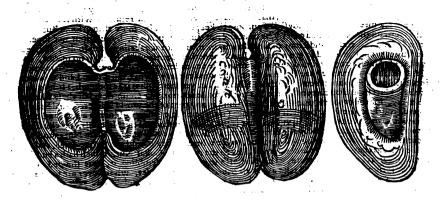

Nucula Indica altera: Another Imali Indian Cokar Not.

The tree that beareth this Nut groweth in great plenty about the Cassell de minus in Ginney, called Palmer by the inhabitants, being tall and as great as a good (hips mast, bearing leaves at the toppe, of a dozen or fisteene footelong, hanging downewards, cut in like unto Reed leaves, from under which leaves grow branches, the fruite being then as bigge as a mans head, containing within them many divers small nuts greater then Plummes of a gold yellow colour; from whose kernels being bruised, they draw a cleere oyle, which they call the oyle of Palme, which they put into their viands, both for the colour and sents sake: this oyle brought into these parts groweth thicke like butter, and is very yellow, which some that brought it used for the cure of their tresh wounds, and annoynted their arteries and sinewes pained with crampes, and convulsions, whereby they sinde much helpe and case. Cluss and described these Nuts to be three square, and to have three holes as it were, at the heads of them like unto the Cokar Nut, covered with a hairy huske, but the shell saith Lobel, is harder then a bone and blacke, whether these be all one I am in some doubt. Further it is said that the Inhabitants by boring the tree, there commeth for tha sweet liquour, almost like the whey of milke, unto which they put a little wild honey, and thereof make their drinke, which they call the wine of the Palme, which will inebriate being largely taken.

Mehenbethene. The Indian Nut Mehenbethene.

This Indian Nut which Clufius saith Cortusus sent unto him for Mebenbethene, but did little agree, saith he, unto the description thereof. Lobel saith it was found among Nutmegs at Astronge: It is saith Lobel both in colour, forme, and greatnesse like unto a Nutmegge (which therefore Clufius saith it might be better referred to the kinds of Nutmeggs, yet very untowardly I thinke) being about an inch long, and three square, whose shell was hard and wooddy like a Cokar Nut, and being broken had three cels or divisions within it, in each whereof was a small long white kernell, of a sweete and pleasant taste.

This kinde of Nut is accounted as another Coccon, it is in many things so like the other, for although it was never seene growing on any tree, as the Indians doe report, the Nuts being onely found upon those stands of the Maldiva, as the Sea casteth them on the shores, and in no other part of the world besides, and are not lawfull to be referved by any, on the paine of their heads, but are all brought to the King or his Officers, in that all wrackes are pertaine to him, and are onely sent by him as presents of great account to other sindian Princes and great persons, &cc. Valessey steady stands concealement, some are diverted other wayes; nor was never steine to have any such rough lunks as the Cokar Nut hath; yet in the inner hard shell; inclosing the inner kernell it is almostically points like the other; the whole Nut carrying this proportion; it is sare greater, longer, and rounder then the other (yet there are of smaller sizes also) and of an ovall forme, containing two parts which are so conjoyed

together in the middle almost all the length, that it is but a little separate both above and below, the upper part being somewhat bigger then the lower, that it feemeth as if two long nuts were set together, but cannot be separated by strength of hands onely, but must be sawed in sunder, the shell being so hard that it searse yeeldeth thereunro without great labour, it is also on the outside much blacker then the other and being polished with the stone Tripele (Tripely we call it) in pouther with water, rubbed with a woollen cloath, (but not with oyle on no hand, for that will give it an evill favour) it will become both blacker and more sweete and shining then the other, as also much thicker, it hath also two holes at the toppes, no leffe them the other Ceem, and may be cut into two long boatelike cups to be edged and footed with filver, Secas every one please, or else each of them again cut into two other to be bordered with mettall, the lower brims to be raifed therewith, and the holes stopped, as it pleaseth every one to doe, or to keepe them for boxes. Clubes fetteth forthin the 19 : page of his Booke of Exotickes, the figure of the one halfe of these Nuts curiously let in filver, which as he faith, he received from Jaques Garret of London, being taken by us in a great Garracke of the Portugals, comming from the East Indies, which was foureteene inches long, and feven broad. The inner kernell hereof is alfo fome what white on the infide, but covered with brownish skinnes both outside and inside, which hath some rifes or clefts, the outside having none, but is much harder then the other, even allmost as hard as a bone, and is a little separated from the woodden shell. which may soone be perceived when it is opened, but may also before, being as it were loose, as may be knowne by the shaking : it is hollow also as the other, as if it contained liquour likewise, but was never seene with any being as it should seeme, wholly consumed by the long time before they were gotten: it hath likewise a small lumpe, as white and cleare as a pearle, flicking to the head of the inner kernell, as the other, which no doubt is the bud which would tring: the kernels on both fides are conjoyed in the middle also. It is usually called by all bud which would bring: the kernels on both fides are conjoyned in the middle allo. It is usually called by all the Christians and forme others in those parts. Coccum de Maldiva, by Angerine Christian in his Tractate thereon, Nux Reference that the theorem of the kernell and outer shell, is as Garcia said, generally held to be good against poysons of all forts and pestilential diseases, to be taken the weight of ten grainer in since fourher (which is best to be made in a morter, by beatings), for it wery hardly yeeldeth to a File, or any other it in take or to be, the kernell being allmost as hard as the outer shell. Anote or less according as the strength of the grain of the result of the case of the less strength of the said while before they drinke, which they account to be a sessectionally. It is also sait he, held by divers worthy bestone the observation of the case there are not other the diseases of the based in reversand singures, and the thereof, either of the drinking out of the case thereof or diseases of the head nerves, and sinewes, and by the use thereof, either of the drinking out of the cups thereof, or the drinke, wherein a peece of the kernell hath beene steeped as is aforesaid, to keepe them take and found from all other diseases: yet Garcia scarse beleeveth any of these things, and Clusture as being led by his ill sample accounterly statistical relations to be fabulous and commentations: but Augering Clusture before spoken of in his tractate ounternation relations to be radiated and commentations: Dut Augersia Cities Described to publish the fundry cures he performed hereby, that is, both the Nut and the fleel, not onely for the poyton of A fenicke, but in Feavers. Epilepties, Cachexia's, and many other difeates there mentioned, but checkally in the fore and tedious travailes of child-birth, giving halfe a dramme of each, or two scruples for additionally in the fore and tedious travailes of child-birth, giving halfe a dramme of each, or two scruples for additionally with other co-adjustres.

Some this section was, wherein I would deliver mine opinion concerning forme particulars, belonging to
this History of the Nut of Maddiva. First concerning that opinion is held, that all those Illands have beene for
ment in our drawn the Continuous and the beauty and the particular and broken areas in the continuous and broken areas by the continuous and broken areas and by the continuous and broken areas and by the continuous and broken areas are a supplied to the continuous and broken areas areas by the continuous and broken areas areas and the continuous and the continuous and the continuous and the continuous areas are a supplied to the continuous and the continuous areas are a supplied to the continuous and the continuous areas are a supplied to the continuous and the continuous areas are a supplied to the continuous areas are a supplied to the continuous and the continuous areas are a supplied to the continuous areas areas areas are a supplied to the continuous areas are a supplied to the continuous areas are a supplied to the continuous areas areas areas are a supplied to the continuous areas are a supp

Some time retirmines, wherein I would deliver mine opinion concerning fome particulars, belonging to this History of the Nix of Maddiva. First concerning that opinion is held, that all those Hands have beene formerly joyned to the Continent, which is hid to be 150. Leagues distant from them, and broken away by tempetts and immundations, which may be as likely as that our life of great Brittaine, was also joyned to the Firme lands? From, and both I thinke alike true, for Cefar found them thus in his Progresse hither, and the Sea hath not it finished and the sea hath not it finished and the sea that the trees either grow on some of the drowned Islands, their rootes abiding fill firme in the ground, yeelding the fruite yearely, and so swimming to Land is taken, where the winde and waves drive the of the grow in the bottome of the Sea, as Amber doth, which may be both also alike true, that is natifier. Againe, that there is a certaine Island called by them Palloger, whereon some others thinke that the tree that bearth these Nuts should grow, and falling when they are ripe, are carryed

Dy

CHAP-444.

1601

by the winde and waves to those Islands are next thereunto, (which I thinke in some part may be probable) but that they adde, that this Island is seene by some that sooke not for it, but cannot be found by them that seeke it although as they fay, the King hath caused fundry times search to be made for it, still they that have beene sent have returned afrighted and terryfied by spirits, that they have given it over and returned with such answers, which in my opinion are meere fables and noyfed of purpose to keepe the Nut in more estimation. But in my judgement if the truth might be fearched exactly, by flout and not timerous persons, by religious not superstitious, as most of the Indians are, and by judicious and industrious men, and not weakelings, and sooles, the tree that beareth these fruices would be found to grow on the Land, whether Continent or Island is no matter, and that if ir be true that these Nuts are onely found on the shores as the Sea casteth them up, for eyes of that report I am more then halfe doubtfull) when they are ripe and false, the windes carry them from off the Land whereon they are false, into the Sea, and to are taken up on those Islands: but yet me thinkes it is somewhat hardly to be beleefaine, into the Sea, and out charming on their manners and yet the continue to to be conveyed, that their Nuts flouid be carryed by the Sea to the coaftes of no other Countries, but their Islands although they be so many, for the report is that they are not found in any part of the world bendes. And lattly, to finish this tedious discourse to shew my opinion how these (if they be sables) may be blowne away, and the truth certainely knowne, viz., if either these Islanders, that is, the King, or some of the Naturalis, or else some Christians, or others in those parts would make choyse of the freshest they could finde of these Nuts, and to put both divers of them, and ar fundry times into the ground, to see whether they would not sprout forth, and spring, for it is probable, that as they are in the inner kernell, like to the ordinary Cokar Nat, which hath a bud therein that hath and will grow, as is shewed before, This Nut also so neerely resembling it, as is shewed, might at one time or another foring and grow, and take away all other doubts and fables, whatfoever are forepassed : This my opinion how it will be accepted I know not, but if any by the tryall thereof thould raffe a tree or more, it would prove a worke no lesse gainefull then memorable to all posterity.

CHAP. XLIII.

Nux Mojchata. The Nutmegge tree,

He Nutmegge tree, and so likewise the fruite are of two sorts exactly observed by Classic, and by him called mas and famina, the mas beareth the greater and the longer Nutmegge, the lefter and rounder the female, and the most ordinary with us, the tree whereof is reported by them that have feenethem, to be very great, and as tall alimost as our Peare trees, spreading many branches, which are greene while they are young, having faire broad leaves fet thereon, some what longer then Bay leaves, or to compare them more truely, like unto the Orrenge tree leaves, but without the lower peeces, and

Nucis Moschate termes gemina.

A true branch of the Nutmegge tree, with the fruite.

Nax Mofchata fen fruilus integer concifus cum tegumento Macis, certice migro & muce interiore rotundo & longo. The whole Nutmegge cut in the middle, the hard shell with the Macis both on it, and of it, and the Nutmegs both long & round.

not so hard nor dented about the edges, but set on a short stalke not one against another, but unequally on the branches, and abide alwayes greene thereon, the fruite (for flowers have not beene observed) groweth at the end of the young branches, and not as Matthiolin fetteth them forth, among the leaves, which are as bigge as Peaches, flanding fingly for the most part, but sometimes two together on a long thicke footestalke, having an oner thicke huske farrowed in the middle, which divideth it felfe into two parts, and growing ripe openeth it felfe, shewing the Nut within, covered with the Macis, cut into severall peeces as it were, and so strictly cleaving to that blacke hard shell whereon it lyeth, that it leavesh the print of the lying of it thereon, and is of an orient crimion colour, while it is fresh and the huske newly separated for it to lye open, but by little the avre changeth the colour to be more dead and yellowish, as we see it brought dry unto us, being taken of from that blacke, thinne, hard shell, that encloseth the Nutmegge it selfe within it, which is somewhat round and firme or folid, diverfly discoloured in veines within, somewhat heavy also, I meane the best, and not light or hollow. and yeelding an oylie moilture upon the pricking thereof with a pinne or needle, and of an excellent aromaticall both sent and taste, yet not so quicke and hot as either Pepper, Ginger, or Cloves.

The other whose Nutmegge is longer and accounted the male, a branch whereof Clusius exhibiteth a part from the other, and describeth it as he received the branch, which was of a foote and an halfe in length, and as thicke as a writing pen of a goole quill, retaining some of the old wood of the last yeare, whose barke was of an ashcolour, but the new forung branch of a brownish red colour, and very pithy in the middle, this branch had seven or eight leaves on it, being much larger and with a thicker footeftalke then the former, and were neere a foote long, but not much thicker then they, and three or foure inches broad, fomewhat hoary underneath and greene and thining above, with divers veines thwarting the middle ribbe: the fruite groweth in the same manner as the former, at the ends of the branches, but more in number set together, in all things like the former, but longer and greater, and nothing so aromaticall insentand taste, yet it is said that the Macis of this fort is much more orient in colour then the last. They have received fundry names, for in Banda where they grow best they call them Palla, and the Macis Bunapalla, but in Decan, Iapatri, and the Macis Jaifol: of Avicenna Iausi band, that is, Nux Bandonfis, and the Macis Befbase. This was not knowne to the ancient Greeke writers, Theophrastus or Dioscorides; no nor to Galen or Pliny, for although some have thought it might be Galen his Chrysobalanos, yet they are sarreawry therein, the later have called it Nux Aromatites, Nux Myristica, and Moschata, as if it were derived a Majoo, for the sweetnesse thereof. They are used in all the cold griefes of the head or braine for pal. fies, the fbrinking of finewes, and the diseases of the mother, they are hot and dry in the second degree, and are somewhat astringent, serving to stay the laske, they cause a sweet breath and amend a stincking, they helpe to discusse winde, either in the stomacke or bowels, it helpeth to quicken the fight, and to comfort the spirits, and provoke urine, and are comfortable to the stomacke, and helpe those that are feeble or macilent to grow fat as also helpeth Venery and encreaseth sperme, they helpe to procure rest and sleepe by allaying the distemper of the spirits, being applyed to the temples. The Macis are of the same property, but somewhat more warming and comforting, the thicke oyle that is drawne both from Macis and Nutmepges, are either of them of good use in pectorall griefes to warme a cold ftomacke, and the cough, and to dry up rheumaticke defiliations of raw and cold ftegme thereunto or upon the lungs. The chimicall oyle of either is of more efficacy both for pectorall and cephaticall diseases, but must be cautelously and sparingly used,

CHAP. XLIV.

Nax I'omica. The Vomiting Nut or Nax vomica.

Lthough we have no true knowledge of the tree that beareth these Nuts (as they are called now adayes ordinarily in our shops) more then what Serapio saith of it, that the tree of the Nux methel, is like the tree of the New vomica, whereby we thinke that our Methel, which is the Stramonium minus with us so called, is the Methel of Serapio, but are much deceived, for his different much from it that we so call, in that Serapio saith of his Methel, that it beareth an oily fruite like Mandragoras, with

an hairy skin or barke, and of no unpleasant taste, and of his New Vomics he saith also (differing notably from ours) that as one Abraham had informed him, it was a fruite bigger then an Hafell Nut, full of nodes or bunches, and of a colour betweene white and blew, and speaking of the properties of them both, he faith that the Methel is cold in the fourth degree, so that if two drams be taken inwardly it killeth, if a lesser quantity it causeth a kinde of stupefying like drunkennesse: and of the Vomica, he faith onely that two drammes thereof taken with a decoction of dill, or with falt, doth marvelloully provoke vomit, but giveth no deadly quality unto it, as he doth to the Methel: whereby it is thought that his Methei is our Fomica, and that his affimilating it to Mandrake is rather to be understood of the quality then of the forme, whereunto it anfwereth, but Avicen describeth the Nux Methel to have short and thicke prickles upon it, and a feed like unto Mandrake; and fuch indeed is the Stramenium to; that you may plainely fee that Serapio confoundeth both these together, both for forme and property: and is likely that he never faw either of them, and therefore the Physicians and Apothecaries were in former times as much mistaken in appointing the one for the other : both pro & contra : but now sceing that they are better knowne, and well distinguished in funder, they are used each according to their property : yet because

TRIBEIT. of the tree was in former times in much use by the ancients but is utterly neglected now a dayes which was more drying and binding then the Gumit selfe; they had also Manna Thurin, which some tooke to be a fort of that dewy Manna that is gathered from trees but were deceived, for it is but the fmall peeces of pouther of the Olibanum which is broken by the carriage: they used also the fulige or soote of it when it was burned being made as blacking for shooes,&c. is made, but is wholly out of use now adayes.

the fruite or nuts are not usuall in our shoppes, but hath beene formerly appointed to bee put into Antidotes and Alexipharmica's (as namely into the Electuarium de Ovo, according to the Philitions of Angulta their receipt: but for their dangerous qualitie thought fit by our Philitions in the Pharmacopea Londinenfis to be expunged and left out) I thought good to shew you them and theuses they are put to for the most part withus a The fruit as is generally scene are flat, round, of the thicknesse of halfe ones finger, almost like unto Lupines but greater, hollowish on the one side, and a little bunched round on the contrary, of a grayish colour with a kinde of Freese or fost Cotten covering the whole, and of so hard a horny substance that they will no way bee beaten into pouther. Lut must be grated on a small Spice grater, but take heed not to grate Spice thereon after. The chiefest use that they are put unto is to kill Dogs and Cats, and other creatures, by mixing some of it with their meate; as also to give unto Crowes, Ravens, and other such like troublesome birds that by their noyse disquiet mens sleepe or fudies, or upon pleasure to ftrew thereof upon flesh, a little sprinkled over with Aquavita, tied fast to some liake or other fuch like thing, which will make them after they have eaten thereof feeme as it were drunke for a time, tumbling off from the poalt or tree upon the ground, there fluttering for a while untill the operation is past and then they will flye away. Some that give it inwardly three or four graines at a time say that it expelleth pestilentiall vapours from the heart, and procureth sweate but not vomit as farre as I can learne, notwithstanding the name, and therefore Matthiolus would have it called Nux Canina rather then Vomica.

CHAP. XLV.

Olibanum five Thus. White Frankumscense.

He generall tenet both of old or ancient and new writers is, that the Francumscence tree doth grow in Arabia, yet Dioscorides faith in India, but Garcias faith none groweth there; and as some fay, the Mirthe and Frankumsence grow in the woods promiseuously together, but the description of the tree in particular was kept close (as it was anciently related) religiously by those that gathered the Gum, but those no doubt were but meere fables and tales to hold it in estimation, as that of the religious Affirian youth, flaine through eavy, and therefore Thus the more accepted by the gods; for fince the rites of Gentilisme here ccased, and Turcisme crept in place, the knowledge thereof by accesse unto places is as hard now as before, onely Theophrastus saith the leaves are like Bay leaves : but Thevet maketh it like the Pinetree, and Garcias saith that it is a low tree with leaves like the Masticke tree, and that the Gum of the mountaine fort is the best, and lasty, Lobel and Pena in their Adverfaria give us the figure of a flrange leafe to bee the leafe of this tree which confifteth of a double fould from the lower end, where it is small and pointed, to the toppe being broad and wide, like unto a Funnell, having as it were a small slippet or peece hanging down, which of all others is the most unlikly to be the leafe of this tree, the forme being of tuch an extraordinary likenes, and may more likely be the leafe of

Clusius his Limonio conger, as I have before shewed you. I have therfore here given you the figure of the tree as Lugdunenfit fetteth it forth. Some have thought that the bark of this tree may be the Narcaphthum (which as some lay (hould be rather Nafcaphthum) of Dioscorides, and called Thus Indaum, for the lews ule it as Incense, and to such ules Dioscorides faith it was applyed, and for the Mother in women. The Gun droppeth from the tree in reasonable plantie into round pecces, tome bigger and leffer then others, and scarce any exceeding the end of ones thumbe, the best is pure, without eyther barke, wood or any other thing, white, yea and the whiter the better, reasonable gummy or fat, not dry like Rossinand consuming quick-ly and wholly into smoake. It is not in the second degree anddry in the first and binding withall. It restraineth bleedings, ftoppeth the laske and the Gonori hea, helpeth the memory, avoideth fadne (fe and melancholly, and comforteth the heart mixed with other things for that cause; it is also very pectorall and good for the cough, for thinne theumes and distillations, and the Plurisie also, mixed with conferve of Roses and taken falting, the sumes thereof when it is burned, being taken in at the mouth and note, the head being covered is very availeable both for the Cough of the Lungs, and those thinne distillations thereon caufing it: the fumes thereof taken beneath, or the application of it in ointment, helpeth the Piles and the Tenafmu, which is a difeate provoking one often to the stoole without doing any thing, it is a fingular good medecine for the rednesse and paines in the eyes, or in the eares: Mirrhe and Olibanam mixed with the white of an egge being beaten and laid on the temples helpeth the Mcgrome and paines in the head: it is of especiall use and account in Balmes, Salves, Plaisters, and Ointments for wounds and Vicers, after their clenfing to incarnate and heale them speedily, and in fractures of the skull most effectually, so that the pia mater be not perished. The barke

CHAP. XLVI.

Piper ejusque species nigrum album longum, &c. Divers forts of Pepper, as blacke, white and long, &c.

Ow fabulous and untrue were the relations of Indian Drugs brought to the ancient writers, Diofeori-

des and others may be plainely discerned, by their description of the plant of Pepper, and the fruit thereof, for Dioscorides saith of its that it groweth on a small tree, and that the fruit at the first is long, which is the long Pepper, baving within it small graines like unto Millet seeds, which in time growing ripe becommeth blacke Pepper, by spreading forth the branches and the graines of Pepper upon them as they are seene: and that the white Pepper is taken before it is sipe, the roote is like unto the Castus and not to Ginger as some say, thus farre he: but the truth is farre otherwise: for Pepper, whether blacks or white differeth not either in manner of growing, nor in forme of leafe or fruite; the long also groweth after the same manner, but differeth in the fruit a now all the forte are sufficiently knowne by our Navigations and frequent transficke into the East Indies, to grow each on a leverall climing buffs, but after one manner, that is, as Hoppes doe with us, so that if they be not instained by some tree, pole, cane or the like, whereon they may clime and spread; will lye downe on the ground, and thereon runne and shoot forth small fibres at every joynt, as hath beene truely observed but the usuall manner is to plant a branch taken from the bush, neare unto some tall and great tree, or as I said some great Cane or such like, and so it will quickly by winding it selfe about it (but not with tendrells as I had some great came or men like, and so it will quickly by winding it help about it (but not with tendrells as a Vine doth) get to the very toppe thereof, being full of joynts, and thooting fairb faire and somewhat large leaves one at a joynt, being almost round, but ending in a point, greener above and paler underneath, with a great middle ribbe, and four other ribes somewhat lesser, spreading from it two on each side, and smaller veines therein also unto the edges which are not dented but smooth and plaine, not thick but samewhat thinne, and set on a pretty long souttalke, the fruit or Pepper it selfs, which abacke, white, or long, groweth at the same south of the lease, and not betweenexthe stalke and the lease, as some have fally joynt but on the contrary side opposite to the lease, and not betweenexthe stalke and the lease, as some have fally fet it downe round about a long stalke, somewhat thinly fet all along thereon, or not so thicke as a bunch of Grapes : the roote hath fundry joynts creeping in the ground with fibres at the joynts, the white Pepper is very hardly

eth in the fame manner as I favd before opposite to each leafe at the joynts,

which are closer fet together then in the blacke, some being greater or lesser, shorter or longer then others, yet none thicker or longer then ones finger, con-

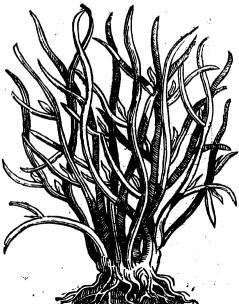

fifting of many small graines as it were fet close together in rower, and not open and seperate as in the blacke and white Pepper, of an ash colour when it is ripe

diffinguished from the blacke by the very inhabitants and planters thereof, untill it come to riper file (for the white and the blacke Pepper dee grow on severall trees or tuil.es)but that the leaves are of a little paler greene colour : the graines or berries are white, folid or firme without wrincles, and more aromaticall. Claffin fift and Banbin m frem him would make a certaine ftrange fruit breught to Cluj m to be the B. e/ma or Brafma of Dieles rides, as Lib. exot, 2. cap. 22. fra Et. 4. but furely Clo fie and Bankinw, yea and Corder also as I verily thinks were deceived in this their opinions, to

Finder Piper lor gam. thinke that Diescovides Brasma was a force

Piper Æthiopicum Matthioli & Piper candatum Oriminko Mamhiolus his Ethiopian Pepper and 2 kind of East India fruire called Pepper with a taile.

s is plainely seene in all that is brought unto us. The blacke Pepper is of much use both with the Indians and other nations for they use to eate the leaves, chawing them a while and spirting them out againe and the Pepper itielle alfo doe they ute to chew, and from the branch take every graine one after another while they are fresh and therein take great pleafure, weufe it most in our meats and fauces to feafon them, and because it is moderatly hot, if not taken too much at once, it is the better accepted and more pleasing to warme the cold stomacke. and to ftirre up an appetite and to confume crude and moit hamours therein, or diffilling from the head; it helpeth to breake and diffolve winde in the stomacke or bowels, to provoke urine, to helpe the cough and other diteases of the breast, and is effectuall against the bittings of Serpents and other poisons, and is therefore put into the great Antidots: but the white Popper as being more hor, sharpe, and aromaticall is of more effect in medicines, and so is the long also being more used to be given for Agues to warme the stomacke before the accesse or comming thereof, thereby to abate the rigour and shakingsall of them are used against the Quinsie being mixed with hony, and taken inwardly as well as applyed outwardly, and disperseth the kernells as well in the throate as in any other part of the body. Matihislus maketh mention of a kinde of Pepper, as he called it Piper Athiopium, the or Athiopicum brought with other wares from Alexandria into Italy, and groweth in long cods like beanes or Main it peale, but many cods fet together at a place, whose graines within them being like Pepper both in forme and tafte, but smaller, and flicke very close to the inside : this fort Serapio setteth downe by the name of Granum Zelin which some erroniously tooke for Carpessum and some for Amonum, Monardus also maketh mention of a kinde Pier los of long Pepper that groweth in all the tract of the continent of the West Indies which is halfe a foot long, and of gur Osen the thicknesse of a small rope consisting of many rowes of small graines fee close together as in the head of Plan-dentale tane and is blacke being ripe, and hotter in taste, more aromaticall and more pleasant and sweet then Capsicum, Monardi. and preferred before blacke Pepper, it groweth faith he on high trees or plants.

Piper longum maritimum Africanum five Folfel tanil Alpino. Long Pepper of Africa. This strange plant shooteh from the roote a great many low round stalkes somewhat like unto Rushes, having here and there someother smaller springing from them, like branches almost as thick as a singer, having thereon a few small leaves in the Spring time, but quickly falling away, scarcely abiding a moneth, and at the tops of some of them come forth small whitish flowers, each standing in a small long huske, in which after groweth the sced. the stalkes being cut or broken, yeeld out a whitish yellow milke or juyce, of a very hot and burning taste, more then ordinary Pepper, Ranunculm, or Tithymall, which caused Imperatus to referre it to the Tithymals. Yet fome tooke it to be Kabra, or Camarrones of Rhafis, Bauhnnus calleth it Piper longum anguftifolium ex Florida.

Piper Candasum racemofum. Pepper with a taile in bunches.

About the yeare 1590, there was brought to Lishborns by the Portugale, from some parts of the East In-

dies, which afterwards wee understood to bee Gninney, a kinde of graine, which they called Pimenta del rabo, that is Pepper with a trile, and grew many together on a long stalke, thicker set, then in ithe ordinary Pepper, every one by it selfe on a short soorestalke, being blackish, round, and firme like Pepper, with a little point or end, wherein it chiefely differed from blacke Pepper, and tasting hot, somewhat like Pepper, but of a sharper and differing aromaticall rellish, and a little lesse then the best fort of Pepper, but with a rugged skinne thereon like it, whether it grew after the same manner of Pepper, none could tell that brought it, but as it is probable by the fight of some of the stalkes, they seemed rather to grow from some upright bush. The King of Portugal forbad the bringing home any more of that fort, left it should villesse the other.

Piper Canarinum carum. A hollow kinde of Pepper of Canara.

Garcias ab Orta, maketh mention of this kinde of Pepper, which in the Malabar language is termed of Caare. It is a kind of hollow graine, of a blewish colour on the outside, and having fundry graines within the hollownesse thereof, which the poorer fort of people doe cate, and therefore as it is thought called Canarynum as if you should say Rusticall or Clownes Pepper for the meanenesse thereof, and therefore not used to be exported.

CHAP. XLVII.

Santalum album, citrinum & rubrum. White, yellow, and red Sanders.

E have in our shops for our use in physicke, onely these three forts of Saunders, whereof the white and the yellow are iweet woods, and the yellow is the sweetest, the red hath no sent. The Samiders tree, as Garcia faith, groweth to be as bigge as the Wallnut tree, having fresh greene leaver like unto the Masticke tree, and darkish blew flowers, the fruite being like unto Cherries for the fize, but without any taste, blacke when they are ripe, and quickely falling away, the wood it felfe is without fent, as it is faid, while it is living, and fresh, and smelleth sweete onely when it is dry, the white and the yellow woods, are fo hard to be diftinguished before that time, as it is said, that none but those Indians that usually fell those trees, doe know their difference before hand, and can tell which will prove better then others : the chiefest part, and imelling iweetest being the heart of the wood, and as the trees doe grow in severall places, so are their goodnesse, being more or lesse plentifull in the substance of the heart, for thereafter are they accounted : The ancient Gracians have made no mention hereof, but the Arabians onely, who generally call it Sandal, but the Natives in the Island Timer, and all the Provinces of Malacca, Chandama, and thois of Canara, Decan, and Surrat, Sercanda; the Latines call that fort pallidum, which others call Citrinum from Avicen, who reckoning three forts, Citrinum Rubrum & Citrinum alterum ve gens ad albedinem quod quidam nominant Makaffari quod alij dicunt melius & validus, which words in Avicen explaine the word Makaffari which Garcias faith he could not understand, and the Pandellary converted ederiferum: they of Malabar have a certaine (weete wood like unto white Saunders (as there are many other fweete woods in other places) but yet is not the right, although they use it as the true is, and instead thereof, calling it Sambarane in the Malabar language. The red Saunders differeth much from both the former, both in place growing farse one from anolanguage, and in former, also colour and fent; it differeth also from the Braffill wood, in that Saunders is neither Xxxxxx

TREBE 17.

(weete in talte, nor giveth any Dye as the Braffill doth, and befides, the Saunders is heavier then it; and will linke in water, it is also a harder and shorter grained wood, and more brittle in breaking short. They are all both cooling and cordiall, and used together in fundry cordials medicines, but the white, and the yellow are the more cordiall and comfortable by reason of their sweetenesse, and the red more cooling and binding, which quality ver neither of the other want, although in a leffe proportion; for the red is used often to stay definitions of thinne return from the head, and to coole hot inflammations, hot gours, and in hot agues, to coole and temper the hear: but the white and yellow are both cordial and cephalicall, applyed with Rolewater to the temples, procuring eafe in the head ache, and are fingular good for weake and familing Romackes, through heate: in the hot fits of agues alfo, they are very profitably applyed in Epithemes or Fomentations, both for the ftomacke, and for the foirits, and palpitations of the heart, which also doe comfort and strengthen them, temperate the melancholly humour, and procureth alacrity and mirth, which qualities are attributed to the yellow more then the white, which is used more to stay and binde suxes of the sperme in man or woman, for which purpose, either the pos-ther taken in a reare egge or mixed with other things for the purpose, or steeped in red Wine; and kept in an hot Balneo, or in hot embers closestopped all night, and strained forth and drunke in the morning and evening, both stayeth the Gonorthes, or running of the reines in men, and the whites in women : applyed also to Maides or womens great brefts, mixed with the juyce of Pu flane, abateth their greatnesse, and represent their overmuch growing,

Theatrson Botanicum.

CHAP. XLVIII.

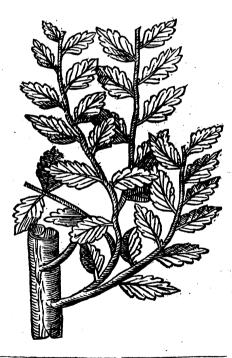

Pfeudosantalus Cretica Abolicea dicta. Bastard red Saunders of Candy.

His tree groweth in Candy, and made knowne to Alpinus, whole figure was fent him as I here thew it you, with this description following. It is a tree that groweth to a reafonable great height, & straight upright, furnished with many armes

and branches, very beautifull to behold, fet with faire greene leaves one at a place, like unto those of Alaternus, but rounder and deeplier endented about the edges: the flowers were not observed what forme or 'colour they bore; but the fruite was round, and of the biggenesse of Pepper cornes, of a darke greenish colour which were not perfectly ripe, when this tree was found. The wood it telfe is somewhat sweete, hard, and reddish so that it seemed like red Saunders especially being made into pourher from whence I thinke saith he, it may not unfitly be called Baltardred Saunders of Candy, some of the wood saith Pona, hath beene brought into Italy, and there fold for Saunders: but it differs from it in that it is nothing to heavy as the true red Saunders is,

P fendofantalus Cretica Abolices dicla. Baftard red Saunders of Candy.

CHAP. XLIX.

Saffaphras. The Saffafras or Ague tree.

He first knowledge of this Sassafras or Ague tree came by the French to our Christian world, and to the Spaniards by driving out the French, who had seated themselves somewhat neere the Florida, which they claimed for themselves for they having gotten Agues, and swellings in their legges, and other discases by lying on the ground in the open aire by bad victuals and raw drinke of water, as the French before them had, by a French man that remained among them, were taught the use of this tree, which he and his Country men had learned before of the Natives, to helpe themselves in these extremities: some Indians call the tree Pavame, and some Winanke: but the French (whom the Spaniard; and all other Nations fince that we it follow) Saffafras, upon what ground or cause is not knowne. The tree groweth great and tall, bare of branches unto a reasonable height covered with a grayish browne barke somewhat thicke, being in talte hotter and quicker then the wood or roote by much: towards the toppe it fpreadeth forth many goodly armes and branches into a round compasse or forme, having large darke greene leaves growing thereon one at a place: standing on the contrary. side, each to other, tasting like the roote but more weakely, some cut into three divisions, somewhat resembling Figge tree leaves, but lesser by the halfe

but more wearry, with a middle ribbe running through each division, and two others to the inner cuts, with veinesbesides, and some with little or no division at all upon them, for both forts wee have seene growing on the same tree. Imouth also and not dented about the edges; the flowers are small and yellow made of threds very like to the Male Cornel tree as Master Iohn Tradescant laith and the fruite small blackish berries, fet in small cups upon long footestalkes many clustring together; the rootes are other forts of Indian trees doe, but are covered with the like brownish barke, that the trunke and branches are but fomewhat redder, which are most in use, being of greater

force and efficacy then any other part of the tree, and tafte somewhat spicelike, rellishing Fennell seede withall, but Clufim compareth the tafte thereof unto the herbe Tarraeon, and is hot and dry in the beginning of the third degree. The decoction whereof is familiarly given in all cold diseases and obstructions of the Liver and spleene, as also in cold theumes and defluxions of the head, on the teeth, eyes, or lunges, warming and drying up the moiflure, and strengthning the parts afterwards, and there-fore is availeable in coughes, and other cold diseases of the breft, stomacke, and lungs, and restraineth castings, and helpeth digestion, breaketh and expelleth winde, the gravell and stone in the kidneyes, and provoketh urine, and womens courfes, it also warmeth, heateth, and dryeth up the moisture of womens wombes, which is in most the cause of birrennesse, and causeth them to be the more apt to conceive: it is of especiall good use in tertian and quotidian agues that come of humours, or are of long contimance: it is thought also to be good in the time of the pestilence, to weare some thereof continually about them, that the smell of it may expell the corrupt and evil vapours of the pestilence : it is generally used in all the diseases

that come of cold and raw, thin, and corrupt humours, the French disease, and other of the like fonle nature: the In-

dians use the leaves being bruised to heale their wounds,

and fores of what foever quality they be.

Saffafras. The Saffaphras or Aguetree

CHAP. L:

Spermaceti. Parmalitty.

Permaceti, that is the spawne of the Whale, usually called in English Parmasitty, is found in the head of one onely fort of Whale fish called Trumpa, which hath no finnes in his mouth, but teeth about a fpanne long, and as thicke as ones wrift: it lyeth in a hole therein, as it were a Well, which is taken out and brought home, after their fifthing for Whales, in barrels, and is afterwards preffed in a prefie, that the thinne oyle may runne from the thicker fubltance, which is that Parmasitry we use, and the more it is pressed the whiter it will be, and of little or no smell, yet the oyle is somewhat strong: this sort of Whale hath but one hole in the head, whereby it spouteth out water, all other forts having two, his head is bigger then others, and bigger then his whole body besides, which is also of a more gray colour : in this Whales entralls, Ambergreise is faid often to be found in more plenty then in other, which it is more likely that they swallow as food, friding it swimming on the Sea water, then that it should breed in them, as diverse have supposed, for I have here showed you the generation of Ambergreese: this Whale also yeeldeth a kind of oyle, as other Whales doe, but it groweth both white and hard, when it is cold, when as all other are liquid like oylo, and never grow hard like it, and therefore it is alwayes kept by it felfe, and not put to others.

CHAP.52.

TRIBEIT.

CHAP. LI.

Tacamahaca. The Gum Tacamahaca.

His Gum, which the Welt Indians call Tacamahaca, the Spaniards and all other Nations retaining the same name, is said to be gathered from a great tree like unto a Poplar, that is, very sweete having ared fruite or berry like unto those of the Peony, more we cannot as yet learne of it. The Gumme is of good and much it for outward remedies, not being knowne to be given inwardly for any in-firmity, although I doubt not but that it might fafely and to good purpose, if judgement were joyned with the triall thereof, but as it is now generally used, it serveth much, yea and most of all in womens disases to retaine the Mothef in its place, by laying a plaister thereof upon the navell s as also when it rifeth up and is ready to strangle them, and for the strengthening thereof, some put Muske and Amber to it, or a little Civet in the

middle of the plailter: This Gumme being (pread on leather and applyed to the side or spleene, that is growne hard and windy, dissolveth the tumours, disperseth the winde and bringeth much ease and helpe to the dispareted part, and is no leffe effectuall in all tumours, griefes, paines and torments in the body or joynts, proceeding of cold raw, and windy humours, applyed platter wife thereon : to be applyed to the ftomacke, with a third part of Storax, a little Ambergriefe, and tome waxe, is a fingular helpe to threngthen the weakeneffe thereof to helpe digeffion, to provoke the appetite, and to diffolve wind: it is of excellent use in the head-ache, and to ftrenethen the braine and memory, as also in all defluxions from the head, into the face, eyes, eares or teeth, caufing fwellings therein, with paines, rednesse, and much perplexity, to be applyed to the temples, or put into the eare, tyed in a little fine filke or cloath; it helpeth also all running humours, and paines thereby in the shoul ders or armes, or any other part of the body, the joynts likewife, goutes and Sciatica, giving befides the feattering of the humours, much eals of the paines, and by the aftriction whereof it partaketh not a little, firenetheneth the parts wonderfully against the virulency of the humours : it maryelloully helpeth all punctures and wounds in the forms, and that fpeedily, healing them and hindering any fpaime or convultion that may happen therein, fo that this gumme ferveth as a remedy in most outward griefes that doe not rife from much heare, and vet therein is not defective, being warily applyed, that is in the declination of the heate to discusse those humoura that remaine: for being hot to the entrance of the third degree and dry in the second, with much astriction also it is most proper for those before recited griefes, and others of the like property. The choyse of the best is, that it be rure and cleane without drosse, cleare also, in some fort of a whirish browne colour, and more whitish in fome parts, of no ftrong but a little quicke and fharpe fent, and quickely confisming into fmoake being cafe on quicke coales.

CHAP. LII.

Ecsule this is, and hath beene a drugge of much respect and use in physicke, alchough no herbe, I could not over passe it, but show you the thing, and the many doubts and salessant the profession of the profess could not over paffe it, but flow you the thing, and the many doubts and falfifications with the umay both know the right and refuse the counterfet and false: for that is the whole scope of my labours in this Worke. viz. to enforme all of the genuine and right things, that they may defire, and know them, and also the best true uses whereunto they serve. First for the Place it is cer-

tainely agreed by all, that the Isle of Lemnos seated in the Egean Sea, called by the Italians and others in thefe dayes Stalimene, was in all former ages and yet is in these times, the place where onely this earth is to be had, which hath beene and Itill is of much citimation in physicke, for the excellent Vertues therein above all the earthes in all other places, and therefore the leverall ages had severall rites whereby to emoble it the more: Diescorides faith of his time that they used to mixe the blood of a Goate with the earth, which Galen in his time (which was long after Dioscorides) being delirous to know, and what proportion of blood was put to the earth, he failed twice to Lemmos for that purpose, but missing of the placethe first time, at the second he came both to feethe place from whence it was taken, and the manner of ordering of it, which was differing from Dissourides his relation, for neither blood nor any thing elfe was mixed therewith, and Galen as he faith him elfe, was laughed at by the people of the better fore, who well underflood the course of their Country for many foregoing ages, for asking such a question of the mixing of Goates blood with it: but the Priest that was then ready prepared to fetch bome a cart full thereof, upon his arrivall there, onely call a certaine number of Wheate and Barley cornes to the earth, as a pacification therewith, and some ceremonious rites, according to the Religion of his Country, caused it to be carryed home, where, having put it into water, they washed the pure earth from the stones and fand, or any other thing in it, which afterwards being dry againe, they make it into small cakes, some bigger or lesser then others, and seale them with the figure of a Goate, the badge of Diana: and therefore they were called Sphragida agios, that is figillum capra or Sphragis Lemnia figillum Lemnium, and the La-

Terra Lemnia vel Sigilata.

tines Terra Lemnia or Terra figillata. Those rites of Gentilisme being ceased, others were brought in and used by the Christians, and when the Venerians were Lords of this isle, as of many other in those Seas, they imposed this order, that but onely one day in a yeare the earth should be digged and carryed away to be used: Forbidding any upon great penalties to take any privily without leave : which cultome the Turkes strictly observe to mig any apon great hill in this ille is much controverted, being suspected not to be the same from whence the earth was taken in Galens time, yet the Greekes of the ille affirme constantly, they never heard or knew of any other place : The earth as Galen faith of it in his time, was called of some Miltos Lemnia, Rubrica Lemnia: because it was in colour reddish like Rubrica Ruddle, but that it did not colour the fingers, as Rubrica Ruddle doth, and this the Priest onely as is before faid sealed : Another fort is the Rubrica which wee take to be our ordinary Bolearmoniacke, and some thinke that our finest and best Orientall Bole, is the true Terra Lemnia. because it is of the same reddish colour, not tainting the fingers, and that the Terra, Lemnia, or figillata, that we have in thete times much differeth from it, and very divers in it selfe one unto another, for some is whitish or very pale red, and that in lumpes or peeces not scaled, others that are scaled now adayes with Arabian Characters, which are interpreted Tin imachton, that is Terra figillata, are not without some doubt of counterfetting, to that of two and twenty forts of their small cakes of fealed earth, which Bellonium faith he had fought out and gorten in the shops of the Druggists in Constantinople, it was hard to judge which of them, or whether any of them were right or no, for as he faith, some cakes were much greater then others, and some of a pale brownish colour, of a fatty substance like tallow, easie to be chewed, and without any grittinesse therein, which some others have, that were more red, and somewhat acide in talte: Some againe had divers red spots in a whitifh earth; and some smell so sweete that it may be thought to be so made; And some againe of a wan colour. tending to yellow, others very gritty betweene the teeth being chewed : thele and divers other varieties, doe shew that coverous esting of much esteeme) is the cause of counterfetting, and besides experience sheweth us, that the earthes of sundry other Countries are found to be of excellent properties, both to provoke sweate, to resilt poyson, and notably to dry and bind fluxes, catarrhes, &c. all which are attributed to the best Terra Lymnia, but Galon in histime had the tryall of the Bolm, or Terra, or Lapin Armenius, which you please to call if, for fundry especiall remedies wherein it was effectuall, as also in a great Plague time in Rome, which he compared to that was in Greece in Thuesdides time, for as he faith, who loever tooke of that Bolus Armenius, diffolved in thinne wine or, water, were faved if they were to be faved, for no other thing could if that did not : and therefore seeing we have so little right Terra Lemnia or sigillata wherein to trust, and so much counterset, whereof we have cause to beware, my advise is rather to use the best fine Bole (which both in forme and quality commeth neetell to the truell Terra Lemnia,) then any other substitute or new found earth, going under the name of the right, although they have divers good properties in them. Let no man impute this as a temerity in me, for could I be affured that we could have true Terra Lemnia, or that the true that now is to be had were of that excellency that Dioferides, Galen and others report of that in their times, I would spare my advise and speake otherwife. Butfeeing I have commended the fine Bole for the best substitute unto Terra Lemnia, let me also declare unto you, although I have faid somewhat before of Bole, the special uses of both of them, that by comparing their properties, you may fee how little they differ in quality : The chiefest of Terra Lemnia, according to Disscorides, is to refill the venome of Serpents, and other deadly poylons, for which cause it is put into the great Antidotesagainst them, and is good also against laskes and fluxes: but Galen letteth them forth more largely, for se he faith, having had a Booke given him when he was in the Isle of Lemnos, by one of the chiefelt men, containing all the properties of Terra Lemnia, he sheweth that besides the remedies of venome and deadly poysons, he had experience of the helpe it gave to those that had eaten of the Sea Hare, or of Cambarides, defending them from all the fits that doe accompany those that have taken of them, as also the biting of a mad dog, and that it wonderfully helpeth old fores that are hard to be cured, and fresh wounds also to consolidate them. The fine Bole of Armenia, Galen sheweth to be admirable effectuall in the plague, as is before said, it also is fingular good in laskes, blooddy flixes, and spitting of blood, for the catarrhe, or defluxion of theume and thinne humours upon the breft and lungs, and shortnesse of breath, marvellously drying and helping them, and likewise against the foule ulcers in the mouth, the ulcers in the lungs or other parts, and the fistula in any, without applying any other thing that might clense it, or take away the callous skinne therein, this onely dryed it, and healed it up.

CHAP. LIII.

Turbub officinarum. The usuall Turbith.

Aving faid fomething before in the Classis of purging Plants, concerning the various forts of Turbith, as divers did take them, and account of them, whereof I meane not to speake agains in this place, but yet I thought good here, to say somewhat more of the true Turbith, which is a forraigne Drugge, and used in the Apothecaries shops, not knowne to us or any other certainely, that hath written thereof, what forme of face the plant truely beareth, whose roote it is: for although Garcias faith, that he saw the plant growing greene and in flower (yet he saith himselfe that it different from that which we use in our shoppes) which he describe the have no great or long roote, whose stalke is like

unto Ivy, spreading on the ground, of a fingers thickenesse or more, and two hands long, and some times much longer: the leaves are like unto those of the Alibea, Marsh Mallow, and so are the flowers of a reddish white, and sometimes all white, but not changing three times a day, as some report of it: that part of the stalke that is next unto the roote and is gummy, is onely used, the rest being too small is of no use: sometimes the roote is gathered with the stalke, which is unprofitable, the stalke onely being of use in Physicke: the whole is insipide without tafte : fo that you may perceive by this description, that this Turbith of Garcias, is but the stalke of an herbe as it feemeth (but our Turbith in shops is plainely deserned to be a roote, yet somewhat small, and of an ash-colour on the outside, and white within, having a pith in the middle, which is cut out and cast away as un-

TRIBE 17.

CHAF.54.

profitable, and some peeces, but not all gummy at the ends having no manifelt taste) which by bruising of it while it is greene, as he faith, veeldeth forth a juyce that hardeneth into a gumme; yet doth Garciae appropriate this Turbith in his following discourse to that which was with them of daily use, taying that the Arabians, Per-Gans, and Turkes call it all by the name of Turbith, by the Indians in Surrat, where it groweth plentifully Barcaman, and in Canara, whereof Goa is a part Tigmar : It groweth also as he saith in other places of India natu rally wilde : but that of Bisnager or Goa; is not used by the Physitions there, but that of Guzatate, which is the beft, from whence alfo as he faith, it is transported into Perfia, Arabia, Afia minor and Portugall. In this discourse of Garcius, I finde tome contrariety as I take it, at least such intricacy, as maketh me doubt it was not so advised-

Theatrum Botanicum.

ly wrieten, as fo worthy a man (whose Workes and labours were as directions to posterity) should have done; for tirlt he faith that the stalke is of use, the roote is unprofitable, and yethe faith this very fame is both called Turbith, and used by the Physitions there, of all nations as the Turbith of the ancients, which that the Indians gather it to fell to the Merchants, that carry it into their Count ies, and yet it was never feene that any fuch gummy stalkes were brenght into these parts of Christendome that I can learne, and fold by the name of Turbith. Agame, Garcias faith that this iris Turbith is farre differing from that which the Arabians describe, and namely that of Melnes, which he describeth with those notes that are in A sorceable unto that Turbith that is every where robe found in all our shops, and yet Garcias taxeth him of erronious describing of it, as though those notes did not agree to the true Turbith that is brought out of the East Indies, by the Portugalls, into Christendome, when as we never faw any other brought from thence, fo that I cannot see how Garcias can be freed from the imputation of much overfight, that tooke his Turbith to be the stalkes, and not the rootes of the Turbith plant: for I verily thinke his Turbith and ours to be all one, and that his errour role onely from being too confident on his Kinsmans relation thereof, to be the stalkes, who as he faith, informed him of the plant, the manner of the gathering and usage thereof by the Indians, and that himfelfe was present with the Indians, and saw the whole ordering of it, and is probable was but his owne conceit and fained to make Garcias beloeve it: for how else could that be differing from that of Mesues, which verily is the same with that, which as I thinke hath beene alwaies brought us for Turbith, and yet be the same the Portagals brought with them from thence, to serve all Christendome. The notes of Mesus his Turbith, which as I said agree so justly with our Turbith, that you may know how

to chase the best are these; but first he saith that it is the roote of an herbe, which hath Ferula like leaves but lesse (which how true it is I cannot say, Mefues peradventure never having seene the plant growing, giveth that note rather by information, which Garcias it may be sheweth by his owne fight but of the roote, which served him for his daily use, he was an eye witnesse and testifyeth of it) and was of the kind of those plants that give milke (and yet not of any Tithymall for divers other plants give milke that are not hot in take as the Tithymalls) and was of divers forts, manured, and wild, great, finall, whire, blacke, and yellow, and growing in dry places as may be perceived by the thickenesse of the juyce (the gumminesse he meaneth) and both greater and smaller rootes, white, and blackish, and yellow, are many times seene altogether with us (which blacknesse or yellownesse may come by the ill drying of the roote, or the taking of some wet in the drying or after)he maketh two markes of the choyleft: that it be white (within) hollow within like a reed or cane (that is when the hard pith of the roote is taken out) gummy with an ash-coloured barke or outside, smooth, and not rugged, easie to be broken. fresh, and not very great or thicke, which is not so good, these notes doe all agree to our Turbith officinarum. Turbith is more used to be given in pou her, and that seldome alone but mixed with other things, or else made into an electuary, then in decoction, and purgeth flegme very notably, and tough clammy humours that fall on the joynts, or on those parts that are more remote: it looseneth the belly of those excrements that sticke close thereto, and clenfeth the breft from thicke flegme: it is very profitably given to those that have a dropsie, the leprofie, or the French discase, as also those that are troubled with those discases that rife from adult humours. the blacke jaundife and the like, it helpeth day agues, and in general all other diseases bred of flegene.

CHAP. LIV.

Unicornu five Corna Mono cerotis. Vnicornes Hornc.

Nicornes Horne likewife is a precious Iewell of high efteeme, and with Princes kept alwayes in their treatury to be uted upon occasion for themselves, whose worth poore men could not easily reach or attaine unto. There are divers bealts that beare two hornes both male and female, as the Oxe, others the males onely, as Decre, Sheepe &c. Some beare three hornes, as certaine Oxen in India, as Solinus reporteth, and some foure, as divers Rammes in fundry Countries hath been observed; yet cassally, not by kinde, and some againe beare but one, whereof some beare it on their nose, as the Rhinoceros, and some in their forehead, as the Indian wild Asse, with a whole hoose as other Asses have, whereof Arifoles and Pliny ipeake, and Orix with a cloven hoofe, related by them also and Columella: as also cersaine Kine in Zeila, a City in Aibiopia, and Campbur, a certaine beast plentitully breeding in the Molucca Islands. that leveth both in the water and on land. Some other creatures also there are that beare but one horne, as cerraine Fishes, breeding plentifully in the Indian Seas, whereof Vierif so called (which I take to be the Sea Vnicorne) is one, and the Sword fish, and certaine birds in Ethiopia as Elianus maketh mention : but of all these creatures with one horne, none are faid or found to have white hornes but the Vnicorne (of the Sca as well as the Land) called by the Hebrewes Rem and Reem (famoused in the Scriptures) by Avicen Achercheden, by some other Arabians Barkaran, by the Greekes Monoceros, and by the Latines Vnicornus, for some are said to be black c others red, Elianus describeth the Indian Asse to have his horne to be whitish at the bottome, reddish at the toppe, and blacke in the middle : the received opinion of the Vnicorne is, that it is a beaft of the fife of a meane horse (but I thinke it cannot be possible but he must be much greater, to beare so large so long, and so massic a horne, fuch as are to be seene in fundry places of Europe, (if such be the horne of any beast) for as Bellonius faith there are twenty whole hornes, and as many that are not wholebut broken, to be seene in severall places in Enrope, one whereof which is the greatest and most noble, is that which is kept in the Church of Saint Dennis by Paris, which is feven foote long at the least, fo that a tall man can hardly reach the toppe thereof with his hand, it weigheth 13 pound and foure ounces, no man can graspe it wholly in his hand, being five inches in the diameter or thickenesse, and an handbredth, and three inches in the circumference, it is straight like a torch or staffe, but writhed about on the outlide, from the right hand to the left smooth, smooth and not bunched out, save at the lower end next unto the head, where it is greatest, and falling still smaller unto the end, of a brownish colour on the outfide, but white like Ivory within, without any line in it, and having but a ring about the outfide, it is also hollow at the bottome, a soote upwards, whereby it may plainely be discerned that it falleth not off of it owne accord, which maketh it to be of the more account) the bealt is faid to be of the colour of a Weafell, or fomewhat more red (yet some say grayish) having a head like a Hart, the necke and maine not very long, with thinne haires, and falling to one side, with a small beard like a Goate but lesser and shorter, the thighes and legs, not great, the hoose parted and the taile like a Boare: but none of the auncient Writers, have made mention of any Physicall properties therein, Elians onely accepted 116.4.6.52. Who yet faith the home is blacke. The property of the Vnicornes horse is cheifly to refist poylon, and the bitings of venemous creatures, it is also given against the plague and other contagious diseases, to expell melancholly likewise, and to chetish, exhilirate, and strengthen the vitall spirits, and more noble parts. It hath alwayes beene accounted of great worth, and not but for great persons and Princes, for the beast being rare and seldome to be steene or had, being so wilde and fierce that he is not to be made tame (how loever some have written that they will grow milde at the light of young Maidens, and be brought to sleepe neere unto them) and the hornes not to be had (in that they doe not call them as some other beasts doe) but by the death of the beast, that liveth so farre remote from these parts, and in huge vast Wildernesses among other most fierce and wilde beasts, Tigers, and Panthers, &c. and especially because the Indians hunt them not either for their pleasure, or to make any profit by them, the Merchants not seeking after them, the hornes I fay, must needes be rare and scarce to be had, and of great worth and price, if they be had, which keepeth them in the more high efteeme. And therefore there want not Imposters, that for lucre fake, doe counterfet it, and worke Ivory, and other hornes artificially into peeces of severall shapes and formes, and obtrude them for Vnicornes horne, to many ignorant persons, but the true and right horne is in part described here before, but to adde further, that the true horne being broken, sheweth to have some thicke fouldes or coates one over another, the infide is white, though the outfide is not fo white but brownish, and a very smooth graine, without any line veine or curled waving therein, having onely a circle fometimes about the edge or brimme. Much V nicornes horne as they fay, is to be had with our Druggilts and Apothecaries, which is in small long round peeces, some no thicker then ones finger or thumbe at the most, or seldome bigger, that is very white, fomewhat heavy and folid, with a smooth graine, which because I cannot thinke so much of the right Land Vnicornes horne is to be had so readily, and so small: I verily beleeve it to be of the Sea Unicorne, which whether it hath that efficacy that the other is faid to have I know not.

And it is somewhat probable that even all those hornes formerly mentioned both in France, Venice, or elsewhere, and that also of our Kings, kept at Windsor, or the Tower, is but of the Sea Vnicorne, for even such as is before described was brought home by Sir Dudley Digges, as I take it found on the shore, and cast up by the Sea in some place towards the North-West, and given to our King Charles, who for the tryall caused his Physicions and others to view it and make report thereof to him. And my felfe having seene it, did well perceive it to be writhed on the outfide, in the manner before faid, and was wonderous white within also, and of a close firms graine: The home was not fully whole, but broken off a little at the end, and hollow at the bottome.

1612

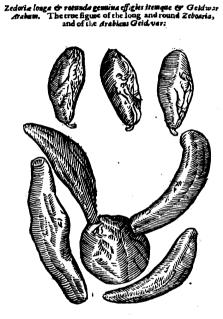

CHAP. LV.

Zedoaria & Zerumbeth. Setwall.

He Setwall that we have usually in our shops, doth not alwayes hold one uniforme face and fashion. but divers, for some is thicke and short, others more long and round, some great, others small, some whole, others broken, as it is usuall in all things almost, either forraigne or domesticke, and yet the severall varieties of formes, being of so little difference cannot make them severall things. specially seeing their taste and quality is all one, or but so little differing that any judicious may soone

determine the controversie. Garcias ab Orta distinguisheth betweene Zedoaria and Zerumbet, making them to be two divers things and therefore speaketh of them in two severall Chapters, wherein as it seemeth he maketh Zedaria to be the Geiduar of Avicen, which yet he faith Avicen knew not, because it groweth in the Chineses Country, and is very rare to be seene or had, but from such vagabond Indians, called Isgues, as travaile begging through all those Countries, which Geidnar or Gedwar, as Garciae faith is of the bignesse of an Ackorne, and

neere unto the same forme, weighing about halfe an ounce, and of a cleere colour, but Clufus giveth us the description and figure of it a little larger, which as he faith he had from Pona of Verona, and compareth them to the imalier rootes of Asphodill, or the rootes of Anthora of an ash-colour on the outside, and yellowish within, and of an hot shar pe taste. Zedoaria is called Zurumbet by Scrapio, and faith they are rootes like unto the round Arifolochia, but of the colour and tafte of Ginger, and brought from China: Avicen faith that Zedoaria is like unto Aristolochia, but leffer, and afterwards fai th, that it is likely to be Geiduar or Algeiduar, and giveth unto it the same qualities that Serapio doth to his Zedoaria or Zerumbers Rhasis maketh Zedoria an d Zerumbet all one, and Me-(nes also seemeth to agree unto them, but differ eth onely in a degree of heate; so that you may plainely fee that all these forts are made by these Authours to be of little or no difference, and so they seeme unto me, as they have also to others before me, who have as I have done, feene all these diversities of forme come over together unto us: Lugdunenfis fetteth downe very truely the figure of Zedowia and Zerumbet, as they grow together, the longer peeces joy-ning to the round like the Ashbodill rootes, to one round head. Garcias ab Orta faith, that Zerumber (or Zerumba, although he maketh them differing as I faid, in one Chapter, yet all one in the next) grow-eth plentifully wild in Malavar Calecut, and Cananor, and is also planted by divers in fundry places, calling it wild Ginger, those of Surrat, Decan, and Canary call it Chacheran, and those of Malavar Sua, and hath leaves like unto Ginger but greater, longer. and broader. There have beene some that have thought Zedoaria to be some of the kindes of Coffus

that Dioscorides describeth, because it agreeth in many things therewith, Zedearia being not specified by him, or the auncient Greekes, and indeed both forme and quality comming so neere may cause it well to be accepted as the substitute thereof. All these forts as they are made divers by the writers of them are said by them to be effectuall against poytons of all fores, and venomes of virulent creatures, and we have found them of much use and profit in the pellilence and other contagious difeases, as also to warme a cold stomacke, and to expell winde mervailoully, to represse vomitings, to dry up and consume catarrhes and defluxions of rheume, to dissolve the Impostumes of the matrix, and to stay the loosenesse of the belly, and is also very powerfull to stay or disperse the unfavoury belchings of those spirits that Garlicke, Onions, &c. or wine have caused.

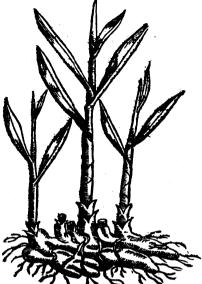

CHAP, LVI.

Zingiber. Gingër.

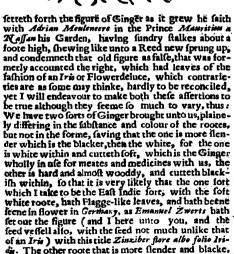

Inger as Garcias (aith groweth in all the Countries of the East Indies, either planted by the roote or fowne of feed, (the roote faith an English rare traveller, spreadeth in the ground, and hath leaves like wild Garlike, which they cur every foresigh a national faith and hath leaves like wild Garlike, which they cut every fortnight, to put into their brothes and meates:) It groweth faith he, with leaves like the water Flagge, or Corne Flagge, and not like the Reed, thus faith he, and so saith the Monardus also, but Acost a saith that it hath leaves very like to the greater sorts of Millet, Lobs teares, and with a thicke stalke like Asphodill leaves thereon, close to the stalke, so that it seemeth to be a small Reed; and Lobel

Ringiber forte brafiltenfe wigre redice. Brafill Ginger with a blacke roote,

Zingiberis filigan & femen. The feed pody and feed of Ginger,

Zingiber vrientale florescene The figure of the orientall Ginger with the flower-

yet of the same fashion, may be that which beareth Reed-like leaves, as Lobel hath set it forth, rather to be preserved then for ordinary use with us, and which as I thinke is the Mechinum of Lobel, or Zingiber fuseum: whereof he giveth the figure of a more excellent fort, that was joynted like Doronicum parts, and therefore accounted by Pona to be the true Doronicum, as is shewed before in this worke, in the Chapter of Doronicum, and counted by rong to be the true Doronseum, as is increased before in this worke, in the Chapter of Doronseum, and brought from Braffill? So that the matter being thus reconciled, and each of them forted as they should be, let me thew you that both form are preferved while they are fresh and greene, and the blacke fort as well also, after it hath beene dryed, by new steeping it, and boyling to make it tender, but I cannot finde that the whise sort will so well serve to be preserved after it hath beene dryed, but is the best being preserved greene, such as the China and Bengala Ginger is. The properties of Ginger is to warme a cold stomacke, and to helpe diffession, to

diffolve wind both there and in the bowels, while it is fresh it is eaten in sallets with the Indians, the roote being fliced and put among the herbes, and helpeth to mollefie and loofen the belly by the moilture therein, which then abateth much of the heate which being dry it hath, and helpeth to bind the belly. The preferved Ginger is most acceptable and comfortable to the stomacke, and is availeable to all the purposes aforesaid.

CHAP. L VII.

Zibettum. Civet.

I Ivet, called Algalia by the Indians, and the beast from whence it is taken Algali or Aligali, is well knowne now adayes to all, to be an excrementitious moisture, or condensate sweate of a certaine beatt somewhat like unto a great Cat, and thereon called a Civet Cat, gathered from a peculiar place or purse in that Cat, prepared by nature for that speciall purpose, and is taken forth with small spoones of Ivory or wood, and that by strong hand, the beast being held very close and

hard for feare of biting, while they are in taking it forth, for it is very fell and fierce, being moved and angered, and then most when they are about that businesse. I shall not need to describe the beast unto you, which Clusius hath done in figure very exactly in his Cura Posteriores, and is so frequent, not onely in our Land. with a great many that keepe them for the profit or use of the Civet, but in divers other Countries in Europe. The Civet is used as a perfume or sweete sent generally, either by it selfe or mixed with other sweete things, it is used also to comfort the head and braine, and to helpe the deafenesse and dissings in the cares, being put thereinto, wrapped in a little blacke wooll, it is much commended against the suffocations or tising of the mother, to be used in a plainter, or but put on the middle of the plaister and laid on the Navell, or some put into the Navell. I know none that ever used it inwardly, but in outward remedies : it is faid that women are much delighted therewith, and helping fundry of their defects.

Having thus the wed you here most of the chiefest Drugges in our Apothecaries shops, that come to us from forraigne parts, that are not formerly expressed in this Worke in severall places & Let me now lastly to close up this whole Worke, flew you other strange and rare Plants, both Herbes and Trees, with their Gummes, Seeds. Rootes, and Fruites, &c. growing in the Eaft, and West Indies, and those parts neere unto them, as they have beene observed by those that in their travells law them, and brought many of them into Europe; that wee may contemplate the wonderfull Workes of God, that hath stored those Countries with such differing Herbes and Trees from ours, and yet it is very certaine that there is much more unknowne then is already made knowne unto us. I will first beginne with Herbes, and the parts thereof, as feedes and rootes, whether medicinable or admirable, and then with the Trees and their fruites that are pleasant to eate; and lastly with those which for the most part have some medicinalluse.

CHAP. LVIII.

Payco berba. Indian Plantaine for the stone.

Herba al

bis estilis.

Cackes fe.

renum mor-

Here growethin Pern in the Welt Indies, an Herbe whole leaves are like unto our Plantaine, which being dryed are very thinne, and tafte hot and extreame bitter. The pouther of them taken in Wine, helpeth the chollicke and the stone, whether proceeding of wind, or of any cold cause, the leaves boyled and applyed warme to the pained part, worketh the same effect.

Another Herbe likewise was sent from thence like unto Lettice new sprung up, and of the same colour, being without talle and very profitable for the stone in the kidneyes, comming from heate, the juyce being applyed to the place mixed with some oyntment of Roses, and the leaves also laid thereto: the juyce thereof likewife coo eth inflammations, Saint Anthonyes fire and the like hot eruptions in the skinne, and cafeth

From Peru likewise saith Monardus came the seed of a bushy plant, there called Caches, being very small and taken from the fruite thereof, which was like unto the Mala in sana, Madde Appels, slat on the one part, and round on the other, of an ash colour on the outside, and of an excellent greene colour but thinne, and of a round forme. It is of much esteeme with the Natives, for the especiall vertues thereof, in provoking urine, and expelling gravell and the stone, yea and breaking the stone in the bladder, if it be not growne hard by long continuance, dissolving it into fand, and casting it forth with the urine, the feed in pouther being taken in some water convenient for the purpole, whereof they have had very many and notable experiences, which fand after it is expelled will grow hard as into flones againe.

CHAP. LXIX.

Coca. The herbe Coca.

He feed of this Coca is fownë with great care by the Well Indians In beds, by rowes, and rileth tobe a plant of three or foure foote high, with a stalke as bigge as a good wand, and somewhat greater leaves then the Myrtle, having as it were another leafe in the middle thereof, being soft, and of a pale greene colour: the berries are red before they be ripe, but blackish afterwards, growing cluftring together, and then they gather the leaves, laying them to dry, that they may be kept all the yeare

and carryed to and fro into leverall Countries, for thereof is the Natives chiefe Merchandife to provide them of all necessaries for life, being instead of money, which is generally used by the Americanes to be chawed, as well in their long journeyes to preferve them from hunger and thirst abroad, as for pleasure at home, which they use after this manner : they burne Oyster shelle wand wich the powther of them they mixe the pouther of the leaves after this manner i they burne Oyster shells wand wishine powther of them they mixe the pouther of the leaves of this foca sind chewed in their monthes, and so made up as it were into a paste or dough (but take less of the powsher of the Oyster shells them of the less's yl wher'to's they make small pellets trockiffs or troffi, laying them to day, and so ascended not by one, holding them in their monthes, rolling them to and fro, and sucking them untill they be quite spent, and sucking them without either means or drinkes; through within blitted places, where none is to be had. If they say a thome, they use the foca alone, chewing them sometimes is who less ay without ceasing untill the substance be sucked forth, and then use another a if shely would have them so be stronger, able to intoxicate their braines like unto drinkennesse, or to be as it were tendesse, they put the leaves of Tobacco to it and take great pleasure in those cour-

The Theater of Plants.

CHAP. LX.

Betre, Betle, Betele, five Bethle. The Indian Bindweed called Betle or Betre.

He East Indians doe use the leaves of this Betle, much after the same manner that they of the West doe the last recited Coca, and therefore I thought good to joyne them together. It groweth very like unto a Bindweede, wrapping and winding it selfe about the trees, up to the toppes almost, or other things that it is planted against to uphold it, or lye on the ground and rot, and therefore they for the most part, plant it against the tree Famile or Areca, or such other like tall and great trees, in the same manner as they doe Pepper, whereunto it is so like that a farre off those that are not well exercised in the knowledge of them, may soone mistake one for another (and therefore Gerard called it Bastard Pepper, when as it is neither

in fruite, taste, oruse like unto Pepper) having onely leaves somewhat like to Pepper, but more like unto Bindeweed, yet thicker, of a yellowish greene colour, with three great thicker tibbes therein (which the Indians with the nailes of their hands, kept long and pointed for this purpose and not round like ours, doe nippe or pare an ay before, they dry them, whose talte is somewhat aromaticall but bitter; the fruite is slender, and about two inches long, writhed or confisting of five cods writhed one about another like unto a cord or rope, of a yellowish colour, tasting pretty spicy or aromaticall, the plant is much tended and often watered to cause it grow the better, and because it delighteth not in any very hot or cold Country, and feldome groweth in the upland Countries, but continually neere the Sea side, or not farre distant from it. Physically this is used to strengthen the head and stomacke, after the clensing of them from rheume and flegme, to comfort the heart, and to breake or discusse winde in the stomacke or bowels : it fastneth loose teeth, and maketh them yellow, causing also a sweet breath, yer their breath stincketh fowlest that using daily to take it, doe forbeare for a while from it: but generally throughout all the East Indies, the leaves are used both of the Princes and people, the greater persons make certaine compositions for themselves, with the leaves hereof, Camfire of Burnes, Lignam A. loes, Muske, and Ambergriefe, others put Cardamomes, and Cloves to them, but the ordinary manner of preparing them is, that after the ribs be taken away with their nayles, they chew those leaves in their mouthes, and spit out the first juyce that commeth from them, which is like blood, and put unto them a little of the calz of burnt Oyftershells, andthe fruite of Areca or Fanfell beaten small which give them a pleasant taste, and is generally eaten by them all, and none of the meaner fort or others that have not prefently before cases thereof, will in civility speake with any great person but they will hold their mouthes that their breath doe not offend those. It is called Betre in Malavar and Pam, in Decan and Guzarete bat in Malaye Siri, Garcias faiths bat he as well as others tooks these leaves to be the Falium Indum, or Malaba. them of the Greeke Authours; but was deceived therein.

Betre five Betle:
The Indian Bindeweed called Betle or Betre.

CHAP. LXI.

Guacatane. Indian Pilewort.

His small herbe as Monardsu faith was sent out of that part of America or the West Indies that is called His imali nerve being white like unto Polium montanum but without any Guardene, Indian Pilewort fueet fent, and is much commended to helpe the fwelling and falling downe of the Piles or hemorrhodiall veines if the herbe be boyled in wine so as there be no heate, or else in water and the grieved place fomented with the warme decoction for a while then gently wiped and the pouther of the herbe cast thereon being bound thereunto: it also easeth aches and paines in any part of the body if the grieved place be first annointed with molten Rossin not too hot, and the pouther of the herbe strewed thereon (which is an homely manner of dressing) and cloathes layd presently upon it which will sticke so fast as that untill it bath wrought the effect it will not be plucked from the skinne and flesh : the pouther of this herbe cast upon any small wound or fore, especially those in the groine, doth clense them and heale them afterwards.

CMAP. LXII.

Herba Indica ad rupturas utilia. Indian Rupture-Wort.

Nother (mall herbe was likewife fent from those parts, whose forme could not be discerned by reason of Notice that neroe was how the tent from those parts, whose formended to helpe Ruptures or bufflings in young or old the herbe being fresh bruifed and applied to the place whereunto a truffe afterwards was bound that had no shoulders, yet sate as close as those that had, and this Ligature the Indians use, which kind of truffe faith Monardus lying so firme and close as he reported that was cured thereby, is sufficient of it selfe to helpe any Rupture without any other medecine, and as he saith he saw a leech of Corduba that help ped all burftings with fuch unshouldred trustes or bindings onely, and many hee knew then living that were so

CEAP. LXIII.

Planta Indica sanguinalis Panacea, id est, sanguineos sudores excitaus; The Indian Allheale, blood (weating plant.

Certaine Indian Leech as it is recorded in Petrus de Ofma his letter to Monardus did usually in the City Passo cure all manner of diseases onely with the juice of a certaine herbe annointing the Arteries and the grieved place therewith, and afterwards laying them to sweate in their beds being well covered, whose sweat was well neere as blood, & in this manner he proceeded untill he saw they had sweat sufficiently, causing them to use in the meane time an excellent fine diet of wholesome meats: sundry desperate difeafes were cured by him, yea they feemed more young and lustie that used this order then they were before; but no intreatie or promise of reward, nor all the meanes that could be used to him, would make him reveale this secret to any, or tell what herbe it was whose juice he used.

CHAP. LXIIII.

Herba vitamant mortem in morbis pranuntians. The Indian Fortune teller of life and death.

Certaine Indian of chiefe account comming into the count de Nieva his house that was in Para upon some occasion of businesse, saw a woman servant of the house very sad and sorrowfull, for that her husband lay then very sicke of a grievous ditease, he asked her if shee would faine know whether het husband should thereof live or dye, the saying yea, he sent her a branch of an herbe- which he willed to be put into his lest hand, and there to hold it fast, which would make him seeme pleasant and merry

if he were to live, but fad and forrow full if he should dy e, which she so using it and finding her husband sodainly to become sicke that she thought he would presently have departed this world, she pulled the herbe out of his hand and threw it away, but within a short time after this her husband dyed : but Monardon faith he doubting of the truth thereof enquired of divers and it was affirmed unto him by a noble man that had long lived in Pers that it was true, and that it is usuall with the Indians to doe so in diseases, which is a matter of great admiration and wonder.

CHAP. LXV.

1. Herba Viva. The Herbe of life or love.

TRIBEIT.

Here are two forts of this kinde of plant that are to be distinguished in sander, and not to be accounrecrease two totts of time Ringe of plant that are knowne to us of late (and yet I thinke verily there be fome others of the famenature, not infliciently yet made knowne to us, which I gather out of the writings and relations of divers. The one is an herbie plane without any prickes or thornes thereon, for any thing that I can learne thereof, and is this I am now about to shew you: The other is both a

finible, or as fome lay a tree, and thorny also which shall follow. Garcias ab Orta first maketh mention thereof in the proving a contract of the East Indies but giveth it no name. Acopta faith it is called by the Christians there to grow in divers places of the East indies but give the Hollands. As Joseph Balth H. Is called by the Christians there generally Herbs viva, and of the Indians Herbs amoris, of the Arabians and Turkes Salue and Saluque: The leaves are compared by them unto the leaves of Pollipsdy, but Acoka rather compareth them to the leaves of Orobus, four or five, or divers rifing from the roote, each upon its footfalke, being winged with many smaller ones then those of Orabus, see on both sides of the stalkes, which are about two inches long a peece, of a pleasant greene colour very beantifull; among which leaves rife up divers slender bare maked stalkes, each of them beating one flower at the toppe in forme fomewhat like unto a Pinke, but of a yellow colour without any fent at ring one hower at the toppe in forme iomewhat like unto a Pinke, out of a yellow colour without any fent at all. The admirable propertie hereof is, that if any shall touch it with their hand, and some say that if any man doe but breath upon it, it will presently draw it selfe together, and if one would take it into their hand it will close together as if it were dead. But that which is more admirable is, that if they shall withdraw their hand it will quickly after as it were revive agains and spread it selfe as it was before it was touched, and this it will doe will quickly after as it were revive against and special touching. Other properties it is fayd to have, many times in a day if it be touched and let alone agains without touching. Other properties it is fayd to have, many times in a day if it be concluded and let alone agains without concerning. Other properties it is layof to nave, as to reftore Virgins that have beene defloured, if ye will believe it, to procure love betweene man and woman, and as Acofea faith he was informed by an Indian Philition of good credit, that he would can'te any woman to be and as Acopta lattil the was intormed by an American a milition of Book of the it (or rather abute it) as he would appoint at his will and pleafure, fo that he would but declare her name, and use it (or rather abute it) as he would appoint him, but the fact being unlawfull, he refused the condition.

2. Fruiex smibilis Herba Mimosa dieta. The Mimicke herbe called the sensitive thorny shrubbe. This other Mimick Mocking or Sensitive plant groweth to be a wooddy Shrubbe, yea some say to be a tree, having divers spring rising from the root, and branching forth sundry leaves set here and there, with short thornes having divers spring at Acost unto other trees or walls, but Glusse sink is spreaded on the ground taking roote or prickles, leaning at Acost unto other trees or walls, but Glusse thereon, which were the ground taking roote or prickies, leaning as Acceptating other thesi of waits, but only mainth the present on the ground taking roote at the joynts, and findry wings of fresh greene leaves thereon, which upon the touch of any man, or his breathing onely, and not of any thing else would shrinke and seeme as withered; but neither flower nor fruit bathing onely, and not of any thing else would shrinke and seeme as withered; but neither flower nor fruit bath should be a spanish relation thereof in a booke should be a supported by the same of the same should be a supported by the same should be a supported by the same should be a supported by the same should be same sh printed at Mexico, that it beareth flowers and fruit fomewhat like unto the Chefnut, many of them hanging printed at Oversies, that it beareth nower and the first and asterwards red, these be others relations: but let mee thew you what I have feene of the living plant as it grew in a pot at Chelfey in Sir John Davers Garden, where divers feeds being fowne therein about the middle of Mø, 1638, and 1639, some of them sprang up to be neared halfe a foot high, yet others were inferiour, the tallest shot two or three stalkes from the root, somewhat hard naire a root nign, yet others were interiour, the cantel thore as also a small short thorne at each and wooddy, with divers joynts on each side, and severall branches thereat, as also a small short thorne at each

1. Herba Viva. The herbe of Life or Love.

2. Fruten fensibilu Herba Mimofa dilla, The thorny sensitive Shrub or Plant.

Yyyyy

joynt.

joynt, which tranches had teverall patres of winged leaves fet opposite each unto other, containing some cight

some ten small leaves on a side without any orde oneanthe end, let very close together, being marrow, smooth, and of a full but fresh greene colour, not fully round pointed nor dented, foulding themselves upward close to the middle ribbe, upon any touch thereof, this is the elder growne plant, but in the think was young the whole stake with scaves would fall downe and shrinke up the leaves: this I proved in those two severall yeares before

recired: the for mer yeares plants as they grew in the pos, I caused a cunning hand to draw to the life, which I here

rectined: the following scares passesses they given in the passe cannot a commany immediate to make the summany with the other, that you may fee the difference betweene it and others formerly fet forth from the fight of a dryea plant. If this could have betwee preferred in our Wisters, our Sommers would have declared a more ample and full dismonthration thereof. This is faid to be not for chicke in apprehension as the former. It is faid also that the stakes have the small and test of Liewis, and are used by the natives usually to helpe the cough.

shortnesse of breath, boarsenesse of the throat and voice, to canse slegme easily to be expectorate, as also to ease the

paines of the stone in the Kidneyes, and healeth up fresh wounds. That Spanish author before recited relateth

also that it procureth sleepe being applyed to the head, but somer with the Americanes then the Spaniards ; said

allo by them to procure love, but could not shew how or by what way; it helpeth the Flux or Lacke of the belly by that aftringent and glutinous qualitie therein perceived by the tafte; as also sertion Agues, and the inflammations and reductic of the eyes. The faid author faith that he understood, yet hee knew not how truely that in the Philippinase they have such another plant yet differing in some particulars, for it is faid theirs shooteth forth ten or a dozen straight everige from a root, each of the biguesse of an Hens quill, one whereof had a dozen leaves on

them in foure rowes fet an distances, fix inches betweene, being like unto Reddish leaves : the flowers were blew

like unto a birds tongue before they were open, and divided it felfe afterwards into three leaves. This upon touch or breathing thereon we uld not fall downe as in the former and rife againe, but faid to fall away, that lasthe lower leaves and folikewife the upper leaves if they were touched agains, but the stake also would breake off and fall downe upon the touch or breathing, and if they should be broken by any once hand, the place would seeme

as blacke as were burned :: but that it would not doe to if it were toucht with a flicke or wand. The Herba Mi.
mof a fremeth likely to be the Achinomenes of Apollidorus, whereof Phiny, lib. 24 c. 17. maketh mention. As allo

that tree that Theophrass is sith, ib. 4.cap. 3. grew about Memphis in Egype which differed not from other trees, either in forme leaves or branches, but in the event for the outward face thereof was thorny, and the leaves like

Perne (as Gaza transfareth it) but Pliny much better like feathers which being touched shranke as withered and

dry, and by and by after revived againe. The Earle of Camberland in Queene Elizabeths dayes brought from the

facke of Portrice some of these plants, but lived not long in the ayre of England, some of the dried and dead once

CHAP. LXVIII.

Manobi forte Brasilianorum. Indian earth nuts or Peale.

Here is growing in fundry places in Braffil and in America also, neare the River Maranon a certains fruit or Peafe breeding under the ground like as puffes doe, without either leafe or roote as Rt is fayd, but they are no bigger then great Peafe, and inclosed in a small grayish thicke and short a cod, very like a small Pescod, with one or two Pease therein, of a pale reddish colour, on the outside and white within, tasting like unto an Almond, which will rattle being shaked in the skinne, growing many together and tyed by small strings. The fruits are caten as junkets with great delighe; for their pleasant taltes take cyther fresh or dryed, but a little tosted make them rellish much bet-

great using the transfer of the better fort as an after course, and doe dry and ftrengthen the ftomacke very much, but taken too liberally breed head ach and heavinesse.

CHAP. LXIX.

Radix Santta Helene. Saint Helens beads, or Indian round fweet Cyperus.

Eare the Port of Saint Hellen which is in Florida, grew cettaine rootes very long and full of knots, of round joynts as great as ones thumbe, blacke without and white within, tafting fomewhat aromaticalllike Galanga, which when they are dry are as hard as an horne, the leaves are large and very greene, growing on stalkes that spread on the ground : it groweth in moist grounds, and is drying in the beginning of the second degree, and heating in the end of the same, the pourher of them taken in wine is used against the paines of the stomacke and bowels, easing the collicke and stone in the Kidneyes, and provoking urine. The Indians use to sprinkle the pouther of the rootes all over their bodies, being ready to goe into the Baths, became as they fay, it bindeth the skinne and firength-

neth the members of the body by its fweet fent. They use there to disjoynt these round knots of the rootes, which being drilled and strung serve them in stead of Beads to tell God how many prayers they will give him at a time. Clasion thinketh these roots may not unfiely bee referred to some kind of Cyperus, but I thinke the large leaves contradict it.

CHAP. LXX.

Radix Quimbaya. Carthagenas purging roots!

Etrus Cieca maketh mention of these roots in the sirst part of his Pernvian history that they are slender, of about a singers thicknesse, growing among the trees in Quinberga, a Province in Pern whose cheife city is Certbage: if some of these roots be taken and steeped in a good quantitie of water all night, they will drinke up most of the water, but yet three owness thereof remaining being drunke doe purge the body so gently and without trouble or perturbation, as if it had been purged with Rubarbe, this hat beene often tryed. Clufien thinketh that these rootes were the same or very like unto such as was sent him by a friend by the name of Bexago vel Pera, which he tooke to be no other then the branches of Atragene or Viorna of that Countrey, they were to like.

CHAP. LXXI.

Rhabarbarum Americanum. Rubarbe of America or West Indie Rubarbe.

Onardus faith, that among other things were fent him out of the maine of the West Indies he had Onerdon faith, that among other things were tent mm out of the maine of the West Indies he had a peace of a roote which they called there by the name of Rubarbe, and was very like the East Indian time. One as her faith it was round, with a brownish coate and reddish core or inside, which being being being, had some whitenesse mixed among it, and coloured the spittle yellow like Saffron, being bitter within my what have a thore was not signified. This is not the white Rubarbe of America, for that as is sayd in its place in the Estate of the Saffron.

lames Lancafter found by chance travailing neare the Sea shore on the East side of the He of Nicubar as also on Sombrers, an Hand which is neare Nienbar & Samuetra, the younger fized, being like small bushes, halfe a yard or two foote high, at the toppes of whom grew foure or five branches full of leaves somewhat round like unto Mirtle leaves, as greene as Sorrell and full of sap or juice; which bushes being strucke by ones foot or otherwise as they passed by, were observed to shrink downe as low as the branches would let them, and rife againe by and by after to the former height; the reason hereof was, that every plant grew out of the mouth or belly of a long living worms within the earth, which drew downe the plant being firucken; but in the elder or greater growne plants the worme was confumed, and the rootes of these bushes being plucked up af-ter they had remained a day two or three above the ground became as hard as Corall: the rest of the bushes remayning as wooddy as other thrubbes. This threefold change or alteration in nature, first from a living worms to a viget ative plant, and then to a from fubfiance, maketh it more admirable above any.

CHAP. LXVII.

Plantanimal eu Borametz Agnus Scythicus. The Scythian Lambe.

His strange living plant as it is reported by divers good authors is called by the Natives Burmetz quast agnellus, by others either Planta Entherica agno similis, or Agnow Scytherus, or by some Planta animal; it groweth among the Tartares about Samarcanda and the parts thereabours rising from a teede somewhat bigger and rounder then a Melon seede, with a stalke about sive paintes high, without any lease thereon, but onely bearing a certaine fruit on the toppe, in forme resembling a small lambe, whole coate or rinde is wolly like unto a Lambes skinne, the pulpe or meate underneath which is like the flesh of a Crevile or Lobser, laving as it is sayd blood also in it; it hath the forme of an head, heaving downe, and seeding on the grafte round about it, untill it hath consumed it and then dyether else will perfish it she grafte cound about it been cut away of sources of surroofe: it thath forme leones also hasoing downes a the Wordsers much affect to feede on bee cut away of purpose : it hath foure legges also hanging downe ; the Woodyen much affect to feede on

Carlo Santto. The Indian Hoppe-like purger. .

is great at the head having fundry smaller sprayes issuing from it, each of the bignesse of one greater single and white, the barke or tinde whereof is easily separated from the rest, and is of most use, smelling somewhat sweet, and talking bitter and somewhat sharpe withall the pith of the roote consistent as it were of many small and very thinne silmes which may easily

Carlo Santo. The Indian Hoppe-like purger,

many small and very thinne filmes which may easily be separated one from another: it is hot and dry in the beginning of the second degree. The barke of the roote being a little chewed in the mouth draweth downe from the head much flegme, whereby theumes catarrhes and destillations therefrom are voyded, and the parts much eafed of paines and other griefes, in fonce also it causeth a vomit, avoyding thereby much choiler and flegme from the stomacke, that oppressed is before and strengthned it afterwards, the decoction thereof worketh better thereon; if a purgation fitting the person be taken before this evacuation upwards, it will doe the more good; the barke being chewed helpeth loofe gummes, putrid and rugged teeth, and maketha (weete breath, but it were good to wash the mouth with a little wine afterwards to take away the bitternesse: the pouther thereof taken in a little white wine, or the decoction thereof with Maiden

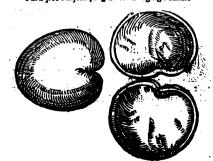

white white, of the detection women of the oblituctions of the mother, the staying of their courses, and consumeth winde in their bodies being formerly purged and prepared, and using Liquidambar & Ung Dealthea of equall parts mixed together, to annoint the lower parts of the belly all the while: the same also helpeth the Simptomes of the heart, as swounings and other the passions thereof, especially rising from the desects of the mother. This decoction likewise is very beneficiall for them that are so troubled, that is to take two drams of the barke, and boile it in three pints of faire water, putting in at the end thereof foure drammes of the barke of Pomeitrons and two drammes of Cinamon, which asserwards being strained, six ounces of this decoction is to be taken with a little Sugar every morning, the body being purged before hand. This ponther and decoction is commended likewise against the French disease, the Epilepse or falling six these of the pourser thereof hath beene often found to cause women to have a speedy delivery, and to take away the passion and saintings in their tedious travailes, being taken either in wine or in some Orenge slower water, the continual use thereof is sene tryed to amend a cold and weake stomake, and to helpe such as could digest no meate: the like use the intermedy and perfect cure to those that have beene bursten, so that they have not used any Trusse months level being perfectly belief thereby.

CHAP. LXXIII.

Faba five Phaseoli purgantes. Purging Beanes?

Onardus speaketh of certaine purging Beanes that grow about Cartagena and Nombre de Dies very like unto our ordinary Beanes but lesser, with a thinne outer skinne, dividing it in the mid-

a thinne outer skinne, dividing it in the middle which was to be cast away, least it might procure too violent evacuation both upward and downeward, even to the hazard of life. With the Indians this is a famous and familiar medecine, purging without trouble flegme, and choller, and groffe humors, and that very gently, the quantity to be taken is from fou.e of them or more according to every ones abilitie, but you must regard that every one of them bee rolled well before they be used, but Clustus faith he could never see such boanes as are here described, but hath had a certaine kind of Phaseoli Kidney beanes sent him under the name of Fabapurgatrices, whose figure is here exhibited, being round and flat on both fides, about a fingers thicknesse and two in breadth or more, yet a little hollow on that fide where it grew to the buske : the outer haske is hard. and in a manner woody, fmooth, and of a darke red colour, being white, and of a firme fubliance within parting

way shout Cartagens and Nambre de Die

The Theater of Plants.

into two as most other pulles do, of the like taste also at the sirst, but quickly hot and sharpe upon the torigue, from whence commeth as it is likly the purging quality: because in some for these resemble the forme of a heart, therefore one called them Cor Divi Thome, Saint Thomas hearts, and besides because they grow in Saint Thomas sland. Classian thinkerth that this is the Beane of the Phasisian Brassianas, whose pods I have shewed you in page 1057.

**Chanardum also speaketh of purging nuts, which he calleth Avellane purgatrices, which grew in Santo Domingo Avellane that were very like unto Hasell nuts, but three square and browne on the outside, with a tough thin shell the kerpell being white and sweeth withall, whereby many were deceived: for they purge very, violently both spwards and downewards choller and slegme, even almost to the danger of life, which by roassing of them before the taking is avoyded: they helpe the Chollicke, and expell winde, and are often put into glisters for that purpose; but I have knowne a glister giver in this manner to good purpose: a glister being ready to be given with a bladder, the similer of a Tobacco pipe was put into the bladder and tyed (but so that it might bee drawne closses after the pipe is pulled out) that had Tobacco in the Bole, which onely blowing the smoake thereof into the

it with the ovle of the Indian Nut, they rowle it in the leaves thereof, and roll it under the hot embers, which being growne (oft. they beate it and then apply it to all such wounds and sores aforesaid, which are perfectly the red within a few dayes, without inflammations or Impostumes, to the wonder of all that knew it not before 1 is like wife eafeth all paines, and ftayeth all fluxes of blood, and is a fingular helpe to the joynts that are pricked or wounded, and briefly ferverth the people that rife no other remedy to helpe themselves in any case of necessity, without the ute of a Chirurgion, and trust thereto as unto an undoubted remedy; the ownement is carryed into fundry other Countryes alfo. Another herbe called Centella groweth in the West Indies, mentioned by Me. nardiu out of Perru de O/ma his Letter to him, who without any description thereof, saith that the Indians doe familiarly use it, and the Spaniara; from them, being bruised and laid to any tumour in the legges or thighes, comming from a cold cause, would cure them by raising blisters that the humours might be let out, and the swelling affwaged. Another herbe also Monardus there remembreth from him likewise, that would stanch the blood of any wound suddenly, seene, and tryed by certaine captive Indians, that through hunger cut off the calves of or any would underly teche, and ryed by certain experts that any and the control their owne legges and did cate them, and prefently applyed the lesses to them, which franched the blood to the great admiration of all that faw it. The same de Ofma saith there, he used a kinde of herbe growing like graffe, which of himfelfe tooke the name, which being chewed would draw downe much flegme, and therefore good for theumes in the head, and defluxions into the throate, and to make lotions to helpe those diseases thereof.

CHAP. LXXVI.

Herba Toannis Infantis. John the Infants herbe.

His is a small herbe growing in the West Indies having leaves like unto Sorrell, but somewhat rough and hairy, and tookethe name from one Iuan Infanta an Indian, the sonne of a Spaniard, who wed it to cure wounds, and to stanch their bleedings, helping all hurts, prickes, and wounds in the linews. or in any other part of the body, digefting clenting, and healing them by laying some of the greene herbe bruifed thereunto : or elfe the pouttier of the dryed herbe ftrowed thereon, which is thought to be better then the ereene herbe.

CHAP. LXXVII.

Lattuca sylvestris pumila. A Lettice for the tooth ache.

Do Nother herbe was sent unto Monardus out of Peru, that was like unto Lettice leaves, but of a darke greene rolour, and very bitter in tafte, the decoction whereof kept a good while in the mouth on that fide that the tooth doth ake, will ease and take away the paine , the juyce of the greene leaves put into an hollow tooth will doe the same.

CHAP. LXXVIII.

Mungo. Indian Coriander like feed for an Ague.

He Indians of the East have a small round seed very like unto Coriander seed, which is greene before, but blacke when it is ripe, being fodder given to horses, and men doe also eate of them: they of Guzarate and Decan, use the decoction thereof against agues, and giving, Mungo similia findia. the feed also being husked, and boyled like Rice, unto their aguish patients Indian Coriander like feed causing them to abstaine from either meate, of bread of Wheate, for many

dayes together : It is held that Avicen mentioneth this in the 481. Chapter of his second Booke, by the name of Messe, Bellunensis his interpreter hath it Mens, but Garcias faith it should be Mex, and so in another place he nameth it.

There hath beene fent also another small crested graine or feed, of the bignesse of Pepper cornes, fo like unto Coriander feed, that at the first fight, one might be soone mistaken, but that it is greater and blacke, this might be thought to be the former Mango, but that this is hot, and the Mango is cold, as it is thought fit for fuch patients.

CHAP. LXXIX.

Arbor Bon cum fruttu suo Buna. The Turkes berry drinke.

then an Hazell Nut and longer, round also, and pointed at the one end, furrowed also on both sides, yet on one fide more conspicuous then the other, that it might be parted into two, in each fide whereof lyeth a small long white kernell, flat on that fide they joyne together, covered with a yellowish skinne, of an acide talle, and somewhat bitter withall and contained in a thinne shell, of a darkish ash-colour : with these berries generally in Arabia and Egipt, and in other places of the Turker Dominions, they make a decoction or drinke, which is in the stead of Wine to them, and generally fold in all their tappe houses, called by the name of Caova : Paludamm taith Choava, and Ranwolfius Chaube. This drinke hath many good Physical properties therein: for it strengtheacth a weake stomacke, helping digeltion, and the tumours and obfiructions of the liver and spleene, being drupke falling for some time together. The Egiptian, and Arabien women use it familiarly while their courfes hold, to cautie them to paffe away with the more case, as also to cause those to flow that are stayed, their bodies being prepared and purged aforehand.

TRIBE 17.

CHAP. LXXX.

Curcus. White Nuts.

Here groweth faith Garcias in divers places of Malavar, a certaine Plant which is fowen and hath the fruite thereof hanging downe from the branches that are like unto Hazell Nuts, but not fo round, and white of colour, whose kernell is sweet somewhat like unto Mushromes, or Spanish puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes, when they are boyled and dressed: they call it Quiviquilenga in some places (which significantly puffes) are some places (which significant nifyeth faith Garcias a small Inhame, but Clufius faith he knoweth it not, except it be the Traff dolce, or funcia avellanada) and in Malavar Curcas, and in Cambaga Carpata : these saith he, are not put to any use in physicke that he knew : he doth conjecture that Serapio meaneth this

fruite by the name of Habaconicasi, which faith he, breedeth abundance of sperme, but bringeth the passion of the chollicke therewith.

CHAP. LXXXI.

Caceras Inderum. Indian Traficotes,

His roote groweth within the ground like as Trasis doe, shooting forth stalkes in the dry time of the yeare, having leaves like the water Flagge, or Corne Flagge, one foulded within another: these rootes being dryed taste like unto Chesnuts: but while they be greene or before they be dryed, they are unpleasant. Clusius thinketh that these tootes be the Malinathalla of Theophrassus, lib. 4.6.10. or the Anthalium of Pliny. About the River Maragnon in Pernigrow certaine fruits under the ground Frudus

like Spanish balles, of the length and bignesse of halfe ones singers, round and somewhat writhed, of a brownish terranase colour, having within it a small mit like an Allmond, which will rattle being shaked when it is dry, browne as Quert without and white within, parting in two parts as an Allmond, of as good a talke as a Filberd, both raw and an Mano roafted, but procuring headache if too liberally eaten: they dry and firengthen the formacke, and are effected as junkets with the Indians and Spaniards.

CHAP. LXXXII.

Banque. The Indian dreamer.

his herbe groweth up with hard stiffe square stalkes like unto Hempe, yet tough and not easie to breake nor to hollow as Hempe, whose Banene. The Indian dreamer. barke may be drawne into threds as well

as Hempe (yet Garcias faith the stalke is wooddy, with but a little barke) of a pale greene colour : the leaves are like unto those of Hemp. dented about the edges, greene on the upper fide, and gray or hoary underneath, of a dry infipide tale: the feed is like unto Hemp feed, but lesse and not so white. The Indians of the East Countries use both leaves juyce and feed thereof, for many purposes both good and bad to stirre up an appetite to meate, and the validity of venerious actions, whereunto they are mighty prone and proclive, and wherein is their chiefe felicity, eating the leaves or feed alone, or with fome Sugar, divers alto doe diverfly compound or mixe it, feme putting thereto in pouther Faufelor Nutmegges, or Cloves, or chovse Camfire or Muske, or Ambar, according to every ones fancy and ability, or as they would be intoxicated, for it will drive them into sleepe, and then grow great dreamers, according to their humours and dispoficions, but if they take it with Opium, as the great men and Souldiours oftentimes doe it, will cause deepe fleepes to make them the more able to undergoe their fore labours, travaile, and watchings in the warre, and to forget them also. But the women oftentimes abuse their husbands hereby in giving it them to fulfill their lust before their faces. Although this plant be in face like unto Hempe, yet the qualites are quite contrary.

CHAP. LXXXIII.

Hincea five Mandiocaex qua Cazavi fic. The true Indian Hincea whereof the Indians bread Cazavi is made

He plant hereof groweth like a small shrub or bush of Elder, and is accounted to be of two distributes forts of leaves, and rifeth to be fixe or feven foote high, with fundry wooddy stalkes, bearing many faire broad leaves thereon, divided into fundry parts, like unto Helleborafter, or the fingers of ones hand, feven or eight together, upon a long footellalke, each part of them being halfe a foote long, and three inches broad, but not endented about the edges, abiding alwayes greene : the one fort of leaves are fomewhat broad towards the points, the other narrower, it hath faith my friend that gave me the intelligence, a small spotted flower, but what fruite followed, hath not yet beene signified by any : the roote groweth quickely great, for it is usually planted every yeare, or every other yeare, and becommeth as great and long as a good great Carrot roote, browne on the outlide, and very white within, the manner to propagate it is, to cut off a stalke about a foote long, and put it more then halfe way into the ground, where it will quickely take roote, and within a yeare or little more be fit to take up and use againe. Of this roote did the Americanes, notwithstanding in many places they had Maix, which is Indian Wheate, both in the Isles and in the Continent, for many hundreds of yeares make their bread whereon they lived in this manner; Having pared away the rinde, the ped or broke small the roote, which is white, sappy, and full of substance, from whence they pressed out the juyce which they kept by it selfe, having an evill smell, whereof who sever tasted, either man or beast, and the same of the without remedy, and that quickely, but if they boyled it to the halfe, it would be come a good wholesome drinke although like finall Ale, and if fet in the Sunne it would be as good vinegar as might be of Wine, and if it were boyled thicke, it would be sweete as hony, and serve for that purpose: the masse from whence the juyce was preffed, they did put into a panne and fet it over the fire to make it grow thicke, and being dry, they made it into pouther, and putting water thereto they formed it into small cakes, and dryed them in the Sun, which they kept for their use, and would abide good for a long time, twenty yeares without corrupting, giving good nourthment to the body, although it would exasperate the lawes and throate in eating thereof, for which purpose they had need of water, or other liquour, to moilten it often, or elfe it would be hard to swallow, being somewhat harsh and sharpe in the throate. This ordering of the roote to make poylon wholsome, is no lesse admirable then Hince five Mandioca genuina Mexicana species dua folijs Cannablais. Two forts of the true West Indian Hempe leafed Hauces.

that the juyce of this roote groweth on the V pland in the Continent, is not any whit hurtfull, as it is faid, although it be hurtfull in the Islands: & this bread was used by all the people of America, from Florida to Pe-7#, and about to the Straights of Magellane, above a thouland miles, yet had they Maiz allo, that is, Indian or Turky Wheate, in most of those places. The Names hereof are very various, according to the Country, for

nereor are very various, according to the Country, totic is called Manibes by Iome, Himcoa, Himcoa, or Incea, according to others, and Cazavi, as they call the bread which the Spaniards doe write Cacavi, that is Cafavi, which is the most general name through all places. We have not heard that the Indians used either herbeor roote to any Physicall remedy.

Like hereunto is that which is called Herich by the Indians, whose leaves are round like Mallowes, and the roote like unto great long Turneps, being of two forts, the one being yellowish the other white, when they are precum. Some would referre this to the Mallow Vingum of Theophrassus, which Pliny calleth Octam.

tatoes.

CHAP. LXXXIV.

Cevadilla Gue Hordeolum caufticum Americanum. The Indian Causticke Barley.

One des faith that among other rare feedes and plants that were fent him from Hiftaniels, he had this also, which they there called Covadilla, that is to fay Hordeo-lum, Small Barley, from the likenesse of

the foiked head of feed unto an care of Barley but leffer, having the feed enclosed in the like chaffie huskes, but is like unto Linfeed, yet greater, whose property is more admirable then ever was heard of in any other herbe or feed, for neither Sublimatum nor fire it felle can effect more in a cautery to be used, therefore it will kill the wormer that breed in foule ulcers, and clenseth those that are foule and stincking, by casting some of the pointer therefore, yet with discretion, according to the greatnesse and fineleneffe of the fore, and using those remedies that are for it, but if it chance to worke too easietly or flarpely they use to dippe tents in Rosewater, or Plainting water, and put them into the ulcers, it is need in the like manner, for the fores of beastes: this feed is not in the foundative gree, and beyond it, if there were any further degree to be reko-

Anana fen Pina. The West Indian delitious Pines.

He Pines (so much esteemed for the most excellent and pleasant sweete fruite in all the West Indies) is the fruite of a kinde of Thiftle, growing with many long, hardstough ftiffe and narrow leaves, thick-off in the middle, and thinne, cut in and dented about the edges, with reddith points, identing prickely like a Thiftle, but are not, from the middle whereof rifeth up a round and fhorter stalke, then that of the wilde fort fet with the like leaves but leffer, and at the toppe one head of the bignesse of a reasonable Muske. Mclon, or Pome Citron, of a yellowish greene before it be ripe, and more yellowish, being through ripe, shewing as it were scaly like an Artichoke at the first view, but more like to a Cone of the Pine tree, which we call a Pine Apple for the forme, yet the outfide hath no hardnesse at all therein, but may be pared and cut like unto a mellow Cotone Peach, being fo sweete in smell that they may be perceived where they be a sarre off, of a faire more plea-fant sweete tathe and substance then it, tasting like as if Wine, Rosewater, and Sugar, were mixed together, having no feede at all in it, whereby it may be encreased : but as some others fay, it hath whitish seed like a Muske-Melon, but leffer and longer; this fruite beareth a bush of leaves at the toppe, and some small heads on-small branches underneath it, which being taken from it and planted halfe way deepe in the ground will take roote. and beare fruite the next yeare, which is the onely manner of propagating. In Braffill is faid that they have fundry forts hereof, one they call Iajama, which is longer and pleasanter then any other, and of a yellowish subtry torts never, one they sail Benjama, being whiter within, and of a mawmish taste, with the luscious field a third they called I jagua, white also within, but tasting like sweete Wine with a little tartnesse. The roote is great with many strings thereat; but perisheth with the stalke after the fruite is ripe. It was first brought from Santa Cruise in Brasil where it is naturall, into both West and East Indies, being not naturall to either of them, but is onely manufed there, and now is growne plenticul: they of Brasilia Call it Nane, others Anane, the Spabut is onely managed the same and results and fo doe most Countryes, following that name, Ovieds in his History calleth it lajand, and Thebet in his fingularities maketh mention of another fruite very like hereunto but growing upon a tree like the Mulberry, with long broad leaves like Angelica, in an Island of the Haft India called Necamere, which fruite they call Melenken, and tafteth as if Sugar and a little Nutmegge were mixed together, which the Natives care to quench their thirst. The chiefest time of their ripenesse is in the Lent, when they are (weetest. But this Pina as I said, surpassed all other fruites of the West Indies, for pleasantnesse and wholesomenesse, so that many tate them abundantly, and thinke they cannot sufficiently be satisfied with them.

> Anna (ca Pina. : .. The West Indian delitious Pincs.

Anua filvefit. Wild Indian Pines.

The Theater of Plants. TREBE 17.

but the furfet of them is dangerous, even as it is usuall of the best fruits : it is not used Physically hitherto that I can learne, but of aporis gratiam wholly front and eatenable Philitions there forbid it their ficke patients, because it is somewhat too hot and might breed inflammations. Some admirable things are reported thereof, one is that if one of these fruits be cut through the middle with a knife and they joyned together agains, the peeces will joyne and sticke so fast together as if it had not been cut at all; another propertie it hath, that if one cut the fruit with a knife and leave the knife flicking therein untill the next day, for much of the blade thereof as flucke within the fruit will be found wholly confuned and wasted, or as it were earn away the knife also that did ont one of them if it be not fordainly wiped but let alone unwiped will seeme as it is had beene eaten in with the form.

There is another wild kinde of Pines growing naturally both greater higher and more prickly or This idelike, has

ving a great tuft of leaves at the bottoms of their stalkes or stems next the ground seeming to be Albe leaves a fire ving a great tult of kaver at the bottoms extheir Italics of them next the ground teeming to be Aloe leaves, a far off but leffer, and of a palargreene colour for with fharpe prickes, it is encreased by the of fext, one rifing from another; from the maine begin grow fundity beanches bearing at their ends, heads of fost tender leaves closed round together, which are nothing butche fluwers, and are of a yellowish color finelling very sweetcout of these heads rise spiller not malling to those of the Reede but thicker, closer set and farter more beautifull, smelling like the Cedar's from the branches hang downer the fruit called by the Pornegalis Anona by avas, that is, wild Anona or Finas which doe somewhat resemble the former or manned kinde, of the bignesse of a Melon, of a beautifull or the control of the rithment when they are eases, and is therefore more P hifteslly used, for fix or eight ounces of the juice taken in a morning fasting with some Sugar is a most present and certains remedy against the heate or inflammation of the liver or backe, as also against the vicers of the Kidneyes, and soule purulentous urines and the exceriations of the vard : all which difeates this cureth upon three times taking.

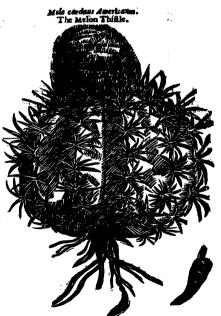

CHAP. LXXXVI.

Melo carduus Americanus. The Melon Thistie.

His admirable plant or fruite bath neither leafe nor stalke, but rifeth immediatly out of the ground! from a small whitish rough stringy roote and many small sibres thereat, into the forme of a Muske

Melon for the bignesse, but made Cone fashion, that is, broad and slat below, and fashion, that is, broad and slat below, and familier up to the soppe, having round about it fourteene ribbes set with sharpe crooked pricks ten or twelve together like a starre in fix, seven or eight places of every ribbe and surrowed betweene, of a yellowish greene colour; from our of the toppe whereof thrusteth forth snadry slikelike downed to the start of the toppe whereof thrusteth forth sindry silkelike downe or Cottony threds, as the Artichokes and other Thistles doe, within which lyë when they are ripe small long slender pointed shathes or code, of a perfect crimson coloui, tesembling the long codded Cappinum or Ginny Pepper, where in acquained small round feed like the Amaranthus, set with hard yellowish prickes at the head the rinde heited is hard and thicke like unto a Melon, which may be pared away like it, maker which the pulpe or meate bytesh white in colour, farty in secling of an undavory some taste, water in addecing. This plant growth weite the Sea shows in divers listed so other west ratios as Saing Margeri Saint Islam, and others neare many Pannaraine. One of the fruits hat beene brought acond themselves we know or no other use this fruit is put unto, the this is the for time of the yeare they eate it to queen their third and cools the heare of their stomacket.

the heare of their fromackes.

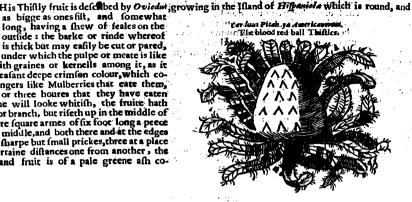

CHAP. EXXXVII.

Cardum Pitahaya Americanorum. The blood red ball Thiftle.

as bigge as ones filt, and somewhat long, having a shew of seales on the outside : the barke or rinde whereof is thick but may eafily be cut or pared,

under which the pulpe or meate is like unto a Figge with graines or kernells among it, as it hath, but of a pleasant deepe crimson colour, which coloureth their fingers like Mulberries that eate them, and after two or three houres that they have eaten them their urine will looke whitish, the fruite hath neither leafe nor branch, but rifeth up in the middle of many great foure fourte armes of fix foot long a peece channeld in the middle, and both there and at the edges fet full of molt sharpe but small prickes, three at a place together at certaine distances one from another, the whole plant and fruit is of a pale greene ash colour.

CHAP. LXXXVIII.

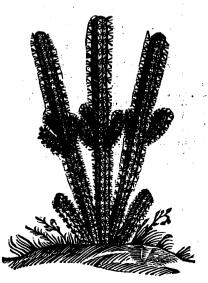

Cereus spinosus Americanus. The Torch Thistle of America.

His small plant scemeth somewhat like the last, but that it riseth up with divers stalkes 19. for 20. cubits high, with fome outward ribbes all the length of them, and fet at feverall spaces with small short thornes standing like small starres, the forme of them very like unro the Melon Thi-

file, these stalkes have some short branches, and at the toppes flowers like the purple Foxglove, and fruite following of a bright crimfon colour like a Figge, but without talte, the stalkes are wooddy of the bignesse of ones wrift of a griftly substance, and of a bitter gummy tast like Aloes.

Cerem fpinofus Americania. The Torch Think of awerica.

CHAP. LXXXIX.

Planta pinnata arundinacea spinosa. The winged thorny Reede.

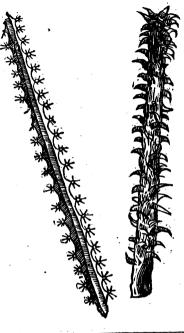

TRIBE 17.

length thereof and at the outer ends of the waved welt small startes of sharpe pricks or thornes: more hereof cannot be faid for that more was not brought, but that thereby you may behold the admirable workes of God in plants as well as in all his other creatures.

Hereunto is adjoyned another thorny plant brought from these parts, which seemed either the body or the branch of a blacke berry like tree, being a solid firme heavy wood, armed very thicke with great long and fironge thornes at certaine tubers or knots, the barke being thicke and blackish.

Observe I pray you that the former of these two defcriptions belongeth to the Cereus fpinofus and that description to be set in the place of it.

Planta pinnata /pinofa & Rubifacie fentico a planta. The farre Thifte-like plant of America, and a bramble bufh-like stalke of america.

Rubufacis lentico/a Plante.

CHAP. XC.

Canna Indica portentofa longitudinia. Indian Reede staves.

N the Westerneside of Sumaira and in other places also of those Indies grew Canes (for wee know not how else to terme them) or Reedes called by them Ruttan of an incredible length, for riling from the ground; they will mount up to the toppe of the highest tree in growth there next unto them, and descending to the ground againe, it will runne thereon on a great way; and fometimes divide it selfe to severall wayes, and afterwards coile it selfe as a Cablest kids on this horse he also the lamba of this in substant he communication. Cable is laid on shipbord or else where, to the length of thirtie fathome by computation, and

then runne againe over a tree sometimes or else coile it selfe againe as formerly, so that neither beginning or end thereof is found : it hath not beene observed that it hath any leaves on it, but are very plyant and bending as one will while they are fresh and greene, and would serve in stead of ropes ; but when they are old and dry, they will ferve in flead of walking flaves, as they are much used with many of us now a dayes or to any other such putpole, they are no harder or bigger then an ordinary cudgell, yet may one ftrike fire from them by firiking one against another, which neverthelesse are porous and hollow as it were in the middle, so that one may blow winde through them at never fo great a length, and at a reasonable staffes length almost so strongly, to blow out a candle fet at the further end, at the least sensibly to be felt, yet no appearance of holes therein. I take it to be the same that is called Luncus Indian perofin in Clusius his Cura posteriores, but why I unem I see no reason.

CHAP. XCI.

Canna ingens Mambu vel Bambu dilla. Huge great treelike Canes or Reeds.

Here hath beene broughtens from the East Indies Canes or Reeds of a wondrous bignesse and height. (as may be gueffed by the broken peeces) growing in Malabar chiefly about the Sea coafts, whereon at the inhabitants make posts to build their cottages withall, as also doe cut them at a certaine length like unto a Cowlettaffe to beare burth ins, and bend them while they are fresh that they may bee a little crooked and hollowish, to hange a Palankin, that is a couch or litter wherein persons

may bee carried in their journying from place to place or otherwise for state or ease, by two or foure Indians's one peece having fix joynts was eight foote long, each space betweene the joynts being a foote and foure inches: it was five inches over at the bigger end, and almost as much at the lesser: the circumference or compasse about at the lower end. being fixteere inches and almost as much at the upper: the thicknesse of the wooddy compasse of the Cane was about three inches by meafure : and was all overlayd with Lask or Gum Lacca, or hard Wax to kep it from the weather, and from cracking in the Sunne, being found in the great Admirall Carrack or shippe of the Portugalls, that brought home the Vicerov of the Indies, and was taken by our English 1593.as a Prize; but greater and longer Reedes were brought from those parts by the Hollanders, yet not whole bur broken, the least whereof was 26. foot long, with 19 joynts therein, being 17. inches about at the lower end and 14, at the upper : a greater was a foote and a halfe longer and three inches more in compaffe then the former, the distance betweene the joynts being neare the length of the circumference, or not much differing any where; the thicknesse likewise being three inches or thereabouts as in the former: by thefe preces may bee gueffed of what huge height thefe Canes were at the plants of their Pepper doe they oftentimes fasten downe these Reedes, that the Pepper in the growing may leane thereunto, and be sustained by them which without some Proppe or stay would lye downe on the ground and become unprofitable. In some places of the Indies say both Garcias and Acosta these Reed like trees grow to great, that sometimes of them are made small boates, sufficient to hold two naked Indians, which they cleave in the middle and cut off beyond the two joynts, so that an Indian fitting at each end, joyned knee to knee, and a finall Oare in each of their hands of halfe a yard long. they will so nimb'y force the Boate, yea even against

a streame that it is wonderfull to behold, which as Acofta faith he faw in the River Cranganor where ma-

Cama ingens Mambu vel Bambu dilla.

House great treclike Canes or Reedes.

ny Crocodils breede which are most fierce and tetrible, and will assaile shippes and other smaller vessells to get fome prey out of them : but as it is faid will never make affault against any of the boats made of this tree or reede, por against them in it. Of the roote of this tree being burned is made Tahazir, that is, the Spedium of the ancient Authors, as Avicen thought, and o Gerardus Cremonensis and Bellinensis doc alwayes translate the word Tabaxir, but Garcias sheweth that it is a very falle interpretation, there being but one Spodium of the Greekes which is our Lapin tutis uted by them onely in outward medecines, for Tabaxir being a Persian word signifieth nothing else but a milky juice or liquor growne thicke, and hereby the Arabians do still call that concrete or hardened liquor that groweth betweene the joynts of this Reede or Tree, but the Natives of Sasar Mansbu, that is Sugar of Mambu, but is not found in all places as Garcias faith, but in Bisnagar, Batecala, and tome part of Malabar chiefly, and is seene to bee of sundry colours, as white like Starch which is the best, yet is it found sometimes of an ash colour or blackish, which yet is not to be misliked, for foit is to be taken out of the Canes, and hath beene in former times esteemed of the value of silver, and yet holdeth a great price even with the Indians, &c. there had neede therefore of great caution of using Spedium (as it is taken) in the Arabians medicines, which are for the most part all inward which is farre differing from Tabasir as you here see, and of all is taken for the fittest Antispodium, and those other of Oxe bones burned and the like to be utterly cast away. The tree hath leaves faith Garciae like an Olive but longer: the properties whereof are effectuall cyther in outward or inward heates, hot chollerick Agues and fluxes that come of choller to coole, temper and binde them. And now that I have shewed you all the Physicall herbes let me descend to the trees and prepose them that have delightfull and pleasant fruits, that you may take therein some pleasure to mix with the profitable or admirable that shall follow: and the first that I will propound as Garcia saith is the chiefest and choysest fruite in all the Indies.

CHAPY XCII.

Mangas. The Indian hony Plumme.

TRIBE 17.

His tree groweth tall like a Peare tree, with somewhat long leaves, more like unto a Peach then a Plumme: the flowers grow from among the leaves, many being fet on a long footestalke like the long Birds Cherry, or cluster Cherry, after which follow the fruite, some being as bigge as a small Melon, and weigh neere about two pound, the lester about the bignesse of a Goose egge, and others betweene thee fizes, as the climates and fetrility of the foile caufeth them, all of them being longer then a Plumme, and with a thinne skinne, greene before they be ripe, but

of a vellowish greene and some reddish when they are ripe and thining withall, smelling very well, but talling much better, and sweeter, so that some are to be eaten when others are reserved to fland, having a long stone in the middle like unto a long Allmond in the shell, but covered with a whitish downe or freeze, and a white bitrer kernell within : Some trees beare twice a yeare, in the Spring and Fall : but generally they are ripe according to the heate, and temperatenesse of the climate even from April unto November in one place or another, for they are found in many Provinces of India, as Malabar, Balagate, and Bengala, Guzarate, Pegu, Malaca, Goa, & Ormuz,

which are accounted the best, and called generally Mangas by the Indians, yet by some Ambo, and by the Turkes and Persians Amba. The fruite is ordered many wayes, as either preserved in Sugar, or pickled up like Ollives before they be through ripe, and are then fomewhat hat ih and binding : or caten fresh, being cutinto slices and dipped in Wine or without and to eaten. They are cold and moift, and yet the Indian Physitions, as well as the vulgar doe hold them to be hot, faying they breed cholle-ricke feavers, inflammations, itches, and feabbes, unto all which difeafes they are subject, which care none of them at all, in respect of the heate of the yeare, when those fruites are chiefely ripe and are eaten. Acofta pictureth this tree with flowers, and

the fruite much differing from this of Linfchoten.

There is another kinde found growing in fome places, but much more rarely, whose fruite hath no stone within it else not differing.

There is likewise a wild kind hereof called Man-

gas bravas, whole tree is leffer then the manured, with shorter and thicker leaves also, and the fruite is of a pale greene colour, having a thicke skinne, and but little pulpetherein, of the biggenesse of a Quince, and with a hard griftly stone within it, yet give they store of milke: they grow generally through all Malabar. If any one cate of these fruites although it be but a little, it is to present a poyson that they dye instantly, and herewith the Indians usually destroy one another, some putting oyle thereto, which maketh it the more speedy in operation, but how foever it is taken it doth fo quickely dispatch them out of this life, that there hath not beene hitherto found a remedy against it. Boyes, there doe usually in spore throw these fruites one at another, as in Spaine they use to doe with greene Orrenges,

Mangas. The Indian Hony Plumme!

CHAP. XCIII.

Genipae. The twining American Peach.

His tree is of two forts, the fruite of the one is edible and greater then the other, which is not to be eaten bearing leaves like the Wallaut tree, and fruite at the end of the branches, being both for colour and bigneffe like unto Peaches one fer upos another in a wonderfull manner : that which is not T ediblehath a certaine cleare blewish Juyce therein like unto Indico, wherewith the Savages dye or colour their bodyes when they have any tolemne meeting of friends, or goe to the flaughter of their enemies, and

they with this ornament thinke themselves as finely decked as we in our bravest filkes,

CHAP, XCIV

Guanabanus Oviedi. The Indian Scaly Muske Melon.

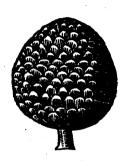

🚅 His delicate fruite groweth on a goodly tall tree in fundry places in the West Indies, whose wood is but weake, having large and long leaves, like unto those of the Pomecitron tree, and very greenetthe fruite is fometime, as bigge as any Melon, and sometimes of the large-nesse of a middle fized Melon, covered with a thinne scaly greenish rinde, somewhat like to a Pineapple for the forme, which may as easily be pared away as a peare, the

meate or pulpe within is very white, fweete, and delicate, and relenting in ones mouth like unto creame: the feedes within are great, like unto Gourdes feed, but formewhat larger and blackish, and are dispersed through the inner pulpe. This fruite is cold and moist, and therefore of especiall use in the heate of the yeare to coole their thirst, and giveth no offence to the stomacke, although one should eate an whole one.

Oviedus mentioneth another fruit called Anon, which he compareth with the Guanabanus, faying that not onely the tree, but the fruite are very like but exceedeth it in goodnesse, being of a firmer substance.

Theret maketh mention of one very like hereunto called by those of the Iland of Zipanga where it groweth Chivey, which in the Springle tongue fignifeetha Figge. The branch being ripe is yellow, and very pleasant in tafte, like unto Manna, melting in ones mouth, containing leede within them like unto those of Cwcombers. The leafe is very round and greene.

Guarakanın Godedi The Indian Scaly Muske Melon.

CHAP. XCV.

Guanabanu Scaligeri. The Ethiopian fowre Gourde.

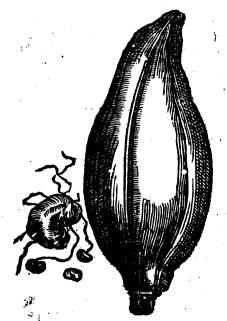

The Ethiopian sowre Courde groweth in Mozambique, and other parts of Ethiopia, on a faire great tree, having large fresh greene leaves, larger then Bay leaves, & comming neerest to those of the Pomecitron tree, the flowers are of a pale whitish colour, and the fruite as great

as a Melon, but longer then it, and ending in a round point, whose rinde is hard and thicke, with sundry ribs thereon, and covered with a greenish freeze or cotton: the pulpe or meate within is whitish while it is fresh, but fonewhat reddish being dry, and then is very brittle alfor that it may be easily rubbed into pouther, having diverse large seed running through it of the forme of a
thicke short kidney or the seedes of Anagyris, the great
beane Trefoile sastemed therein with small sibres to the hollow middle part which pulpe as well dry as greene is of a pleas the farpe talle, yet more tart or sowre, when it is dry then greene: this is used in the extremities of the hot weather to coole and quench thirst, and is effectuall also in all putride and petilientials feavers, the pulpe or iuvce thereof taken with Sugar, or the dryed pouther put into some Plantaine water, or the decoction or infufion thereof, both for the aforesaid causes and to stay the fpitting of blood, or any other hot fluxe of blood or humours in man or woman; this is very like to be the Abavo that Honorius Bellus writeth of in his fourth and fifth Epistles to Clusius and the Babobab of Alpinus.

Somewhat like hercunto is that fruite which Theves Fix N: Somewhat like hereunto is that fruite which Theves gritarum, calleth Fiem Nigritarum, the leaves of the tree are larger then any of those former forces, and hath some divifions therein very like unto Figge leaves: the fruite is fometimes two foote long and thicke, according to the

Not much unlike also is the Higuers of Ovieden, which he describeth in his Indian History: The tree (faith he) is as great as a Mulberry, and the fruite fometimes like unto a long Gourde, & fometimes unto a round, of which round fort the Indians make themselves dishes, platters, and fundry other velicls: The timber whereof is ftrong

Guayava. The West Indian Bay Plumme.

Guayava. The West Indian Bay Plumme.

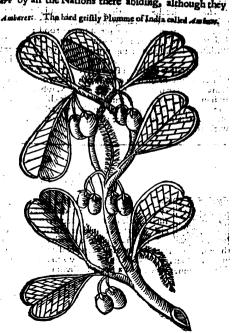

Which they call Guayabo, as they doe the fruite Guayaba,) groweth gettike unto an Orrange tree, but thim rot branches, betting large leaves on them, two alwayes for together, all opposite which are like this Bay textes but larger, were foure inches longs, and one and a halfe, or two these broad, gray or of an heavy assenting underneasts, with great ribs and smaller veines therein, but of a tid greene above, smooth and without any shew of these almost, forms that have in the line. The flowers are like those of the Orrenge or pomecitron tree, smelling sweete like the samines after which followeth the fruite, as greates a small apple, and like unto a Plum, that is, so newhat lines and properly in the received one from Doctor Trees out of Joaine, this was blackish, light and shrunker which is samines to the unripeness of the long that were into the parties of the thrunker which is samines that all the within, and some a white, were fiveness and delicate in taste, divided as it were into tout parts, the act whereof tye many small graines of hard white kennells. The properties of the fruite besides the delicacy to be caten, hath an alwingent power therein to shy laskes, especially if they be eaten while they are greate and not ripe.

CHAP. XCVIII.

Ambares. The hard griftly Plumme of India called Ambare.

He leaves that grow on this great tree, called Ambare by all the Nations there abiding, although they feeme formewhat like those of the Wallaut tree for the largenesse, yet are they not of that sashion, for being small at the bottome, and they are broadest at the end, and a little dented the middle thereof, elaborate with many and of a pale greene colour; the flowers are finall and white, and the fruite that followeth of the bignesse of a Wallnut, with a smoother and paler greene skinne, of a strong heady fent, and fowre harsh taste being unripe, but yellow when it is ripe, and of a more pleasant sent, containing a hard griftly substance within them, with sundry crosse hard nerves or threds running through, yet of so pleasant a tart sowre talte that commendeth it much, and therefore are used by the Natives and strangers also instead of vinegar, or such like sawfe, to rellish their meate, and stirre up an appetite, being eaten with falt and vinegar, while they are fresh or pickled to ferve for the yeares following, which endure very well: they use to give the fresh fruite also to those that have hot agues, to coole their blood and humours.

CHAP. XCIX.

Mele Corcopali. The American Quince Melon tree.

W Orcopall, is a Province of the Indies, wherein as also neere the Promontori Comari, groweth a tree like unto the Quince tree, both for forme and leafe, bearing a large fruite as great as a Melon, with ribbes outlie outlide like thereunto, very sweete and pleasant to be caten, and physicall alto, within which lye three or foure graines or kernells like Grape ftones, which are as bitter as Cherry ftone kernells : the ficke as well as the found doe eate of this fruite, having a quality therein to evacuate evill humours.

In the same Province also of Corcopall groweth a white Mediar as great as an Apple.

CHAP. C.

Davies. The Melon like bearing Orrenge.

Oresis is a fruite called in Samatra, Davian, is also somewhat like unto the fruite in stage of the fruite in stage and take unto fresh within it sive fruites in shape and take unto fresh sweet butter.

CHAP, CL.

Carcapali. The Indian yellow Orrenges of Malavar.

Coffe maketh mention of a great tree in Malabar called Careapuli differing from the Durian, for Corceputi. The Indian yellow Orrenge of Meleter.

the higher helicit mention of a great tree in Malain the higher he fish is like as Orrespo, when the civiler will be taken away, which confiltent of filmery humps of pulses, but to be feparated as they may be in six Orrespo, which risdo is thinne, imports, who finding quality, we pleafast, and are good to they fishes of all fishes, and to relicit a dejected appetion, taken will fower mills or boyled Rice; the Midwiger give it women in hard labour, to cause a speedy schirty, as also to expell the after-birth a the juyer is profusably also to cleare the eyes of mills and rice to the same of the contract. mile and ricemes.

CRAP. CTI.

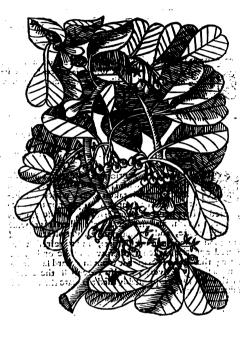

Mala Indica Lusicanis Ber & Bor Acofta. Small Indian Apples.

He tree that beareth this fruite is great, full of branches and leaves, which are somewhat like Apple. tree leaves, but longer and not to round of a fad green on the upper end, & hoary

tafte: the flowers are white, made of fine small leaves without any fent, the fruite is of the bignesse and likenesse of the Injube fruite or plant, some greater and lesser as well as pleasanter then others, yet in the ripelt (which it is teldome feene, that they come to perfect maturity, neither will they last to be transported into other Counties) they hold a certaine binding property, and are good therefore to binde the look belly, but are not so good as Injuber for the stomacke. In Canara and Decan they call the tree Bor or Ber, and in Ma-Liyo Videras, but the Portugals Mansanas de la India, that is Mala Indica, whom wee have followed: those that grow in Malaca are preferred before those of Malabar. In Summer these trees are con. tinually feene loaden with those slics (or winged Antes)that worke gum Lacca thereon.

or woolly on the underfide, aftringent in

Mala Indica Luftinu Ber & Ber Acofte. Small Indian Apples.

CHAP. CIII.

Lamboloins . Indian Ollives.

His tree is somewhat like the Lentiske tree in the barke thereof, but the leaves are like the Strawberry tree with dented leaves, talling like the Mirtle leaves when they are greene, the fruite is very like unto ripe Ollives, but of an harsh and binding taste, able to draw ones mouth awry, yet being pickled up like Ollives, they rellish reasonable well and serve to procure and whet the appetite being eaten with boyled Ryce.

CHAP. CIV.

Carambolas. Furrowed tart Indian Appless

He fruite, which they of Malabar call Carambolas, and Camarix or Carabeli, by those of Canara and Decan, and Bolimba in Malayo, groweth on a tree much like to a Quince tree, whose leaves are longer then Apple tree leaves, of a sad greene colour, and bitterish in taste: the slowers are of a dainty bluth colour but without fent, and of a fower or tart tafte like to Sorrell: the fruite is of the bignesse of a good egge, but somewhat long withall, yellow on the outside, hanging by

and thort stalke, and fet in the small huske, that formerly held the flower, being pointed at the ends divided as it were into foure parts, with furrowes, which being deepely impressed therein, make it the more gracefull, of a pleasant tart talte, very pleasing to the palate and stomacke, in the middle whereof are contained small seedes. These stuites are much used as well to please and stirre up the appetite by reason of their pleasant sharpenesse, as in hor and chollericke agues also, either the juyce of them made into a Syrupe, or the whole fruite preserved in Sugar, or pickled up in brine to serve for aftertimes: some use the juvce thereof with other ocular medicines for to take away the haw, or the pinne and web in the eyes, or any filme be-

ginning to grow over them.

CHAP. CV.

Lambos. Blood red, and blufh Peares of India.

Here is another Indian fruite worthy to be remembred as well for the beauty it beareth in the shew there-

of, and the tweete tent and take it carryeth to the other tentes, as chiefely for the excellent medicinall properties is now daily found out more and more in it. The tree groweth vafte, or huge equalling the greatest Orrenge tree in Spaine, largely spread with great armes which make a spacious shaddow : the body and branches are covered with a grayish barke, the leaves are very faire, and smooth an handfull long or more with a thicke middle tibbe, and other smaller veines therein, of a sad greene on the upperfide, and paler greene underneath, the flowers are of a lively purplish red colour, with divers threds in the middle, very pleasant and standing in a great huske, and ta-sting like Vine branches: the fruite is of the bignesse and fashion of a King Peare, growing out of that large huske, wherein the flower was formerly feated, and are of fundry kindes, for fome are of so deepe a red colour that they seeme allmost blacke, some have no kernell or stone within them, when others have one, which are the best another fort is of a whitish red colour, and filming cleare, having a hard stone within it like to a Peach stone, but smooth, and covered with a white rough skinne, which although it auft give place to the former, yet may well be

Ismber. Red and blufh coloured Peares of India.

accepted

accepted to a dainty palate, the skinne being to tender that as in a Plumme or Cherry, it cannot be pared a way, the smell of each resembleth the Rose, and in property is cold and moilt. The tree is never Without greene and ripe fruite thereon, and blossomes also at all times, which falling abundantly on the ground, make it seems all red therewith, the ripe fruite by the shaking of the tree are soone made to fall, and gathered from under it, as also cassly gathered by hand. The Indians of Malabar and Canara call it Iambolin, the Portugalls that dwell there lambos, the Arabians and Persians Tupha, and Tuphas, the Turkes Alma. They there we to eate this fruit before meate most usually, yet they are not refused at other times also: both flowers and fruite are preserved with Sugar, and kept to give to those that have hot agues to coole their stomackes and liver, and to quench

Theatrum Botanicum.

CHAP. CVI.

Ingomas. Indian Services.

Angomas are Indian fruites like Services, growing on trees not much unlike our Service tree, both in leaves and flowers, but fet with thornes, and are manured or planted in Orchards as well as found wild abroad : the fruite is harsh like an unripe Sloe when it is ripe, and must therefore be rowled betweene the fingers, to make it mellow before it can be eaten, and is generally taken to bindeor restraine, when soever there is cause of such an operation.

CHAP. CVII.

Lencoma. The Indian Chefnut.

His tree groweth very great, and the wood is strong and sirme, having leaves like to the Strawberry tree, the fruite is very like to our Cheinut, as well in colour as bignetie, as allo in that white or foot thereon, but it feemed to have the kernell loofe within it, for that it giveth a noyfe in shaking the fruit is ediole and pleasant, yet a little astringent.

CHAP. CVIII.

Charamei. Purging cornered Hasell nuts.

rabians Ambela, the one is as great as the Medlar tree, with Peare tree pale great leaves, and

yellowish fruite, somewhat like to Hasell or Filberd Nuts, ending in sundry corners, of the raste of sowre Grapes, yet more pleasant, which they pickle up as well being ripe as unripe; and usually ease them with falt. The other kinde is of the same bignesse, but bath lesser leaves then the Apple tree, and a greater fruite, which the Indians use being boyled with Saunders & give the decoction against feavers: the barke of the roote of the former kinde, which groweth by the water fides, is chiefely nsed (10 as it grow farre from the 1ca) which yeeldeth milke, by taking foure fingers length thereof, which being bruifed with a dramme of Mustard seed, they give to those that are pursie and short winded: for it purgeth mightily both upwards and downewards: but if a superpurgation chance thereupon, they give one of the fruits of Carambolas to helpe it, or else a draught of the vinegar of Canara (which is nothing else but the decoction of Rice set by for a day, two or three, untill it grow fower. The fruite is familiarly eaten through all parts, unripe as well as ripe, and pickled, or eaten with falt and vinegar to procure an appetite, putting it to their meates to give them a rellish by reafon of its tartneffe.

Here are two kindes of this tree, called Charamei by all the Indians generally, but the Persians and A-Charamei. Purging cornered Hafell Nuts.

CHAP. CIX.

Isacs or Iscs. The Diamond fathioned Cheinut Courd.

His tree groweth in fundry of the Indian Ilands neare the water fides to be of a vafte bigneffe. having leaves of an hand breadth with a thicke hard ribbe all the length thereof, and of a pale greene colour:

the fruite is very great (not growing from the

laace vellers. The Diamond fashiond Chefour Gourd.

younger branches or with the leaves, but out of the body, and elder boughes thereof) long and thick, the least whereof is greater then the greatest Gourd, having a hard thicke rinde of a darke greene colour, fet with short Diamond pointed like blackish prickes, which a farre off threaten danger in the handling, but thewing favour in doing no harme, which when they are ripe imel iweet, and grow fomewhat foft, that they will yeeld to the prefling of ones hands, and being cut longwile, not athwart, have a thicke yellowith white meate within them, devided into fundry cells or partitions full of long and thicke Chefaut like fruites, greater then any Date, with an afh coloured outlide, and white substance within like a Chesnut, which while they are raw tafte harfh and breed much winde, but being roafted as Chefnuts use to be, or fodden, tafte favory and stirre up venery, for which purpose the people cate them much: the whitish pulpe or substance wherein these lye is of a pleasant taste but hard of disgestion, and breedeth that pestilent disease called Moexi, if they be much or often eaten or that they lye corrupted in the stomack : Those that grow in Malabar are accounted the best, and better then those of Goa; Linfchote faith the two forts hereof are called Girafol and Chambafel, but Paludanne Barca and Papa, and that those other names doe fignisie the goodnesse or meanneffe of wares.

TRIBE 17.

CHAP. CX.

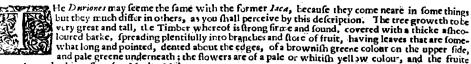

Cachi & Ciccara. The Pine apple like Chefnut Melon.

Here is a prickly or thorny tree growing in Malabar which they call Cachi & the fruit thereof Ciccara. the tree is as great as a Fig tree, with Datelike leaves, and hard wood like Box, which they put to many uses : the fruit groweth not on the branches, but out of the body, and elder boughes as the true Sycamore or Egiptian Fig doth, and is a foore in length, of the thickneffe of ones thigh, and of a brownish yellow outside when it is ripe, being formed somewhat like a Pine apple, and having many severall cells or partitions within it as a Pomegarnet hath; the inner substance whereof is somewhat time

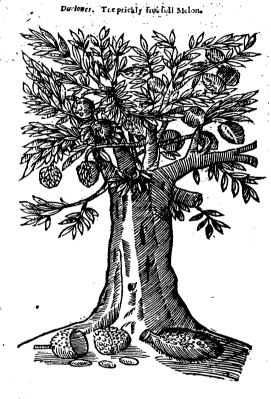

and well fented but tafting like a Muske Melon, a Peach, a fweete Orrenge and hony together; thefe cells containe in them 250. or 300. Small fruits in shape and taste like Figges without skinnes, within every of which fruit is another lefter, refembling a Chefnut, which is eaten roafted by the fire as Chefnuts are, and will cracke like them in the roafting.

CHAP. CXI.

Duriones. The prickly fruitfull Melon.

groweth to the bignesse of a Muske Melon. with a thicke greenish rinde set full of shorte and thicke but sharpe prickles, having some Grakes thereon as the Melon hath : it hath with. in it being opened foure cells or divisions all the length of ir, in every one of which lye three or foure white fruits as bigge as Hens egges (for if they containe five a peece they are not held to bee so good, neither yet if they looke vellowish, and not white they judge them spoiled by the wet falling into the chinkes) like unthe Alingar blanco of the Spaniards, but not for for muccilagie and tafte like unto Creame, finelling somewhat sweet also : each of these finits have enclosed within them a kernell like unto that of the Peach flone, which is fomewhat long and infipide, yet making the throate harsh like unto an unripe Medler, and there-fore are not eaten: These fruits are to be lightly troden on to breake them; because of the prickes, which to them that never did smell them or eate of them before, may feeme to fmell like rotten onions, but having talled of them wil thinke them both to talle and fmell better then other meats: for among the ratives they are held in so good account that they thinke they can never be satisfied with them: but if any by cating too liberally of them shall feare to fall into a Surfeit, or to take any other harme by them, they shall be instantly helped and eased, if ey-ther they lay a leafe of Betre upon the stomack or eate some of the leaves thereof : for so great an antipathy there is between thefe two plants, that if iome leaves of Betre be brought into a shippe or house, where these fruits are laydand kept, they will all rot and putrefie : fo that it bath not beene knowne that any have taken harme by eating of them.

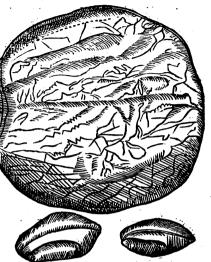

CHAP. CXII.

Totecka Americana Pervana. The Indian fruitfull Gourd bearing Almond, or the Indian Almonds of Cluftur.

He tree that beareth this fruite groweth very great and high, the body being bare of branches or leaves unto a very great height whereit spreadeth into branches standing in compasse together almost like a Crowne, with faire great broad long leaves set on them greater than ones hand; somewhat like but much greater then those of Diepaubonne of a darke greene colour on the upper side, and somewhat white or mealy underneath: the slowers breake forth among the leaves in severall places, and are of a darke greene colour, after which come the fruit, very great when it is ripe and round like a Bowle, but sit on one side whose shells as hard as a bone, hardly admitting to bee bored or siled, and of a darke brownish colour dented in, striped and crumpled almost like unto Corke, so great that one can hardly compasse it with both ones hands and the singers stretched out at length, the height also being neare the same size; this fruite in the inside is divided into six cells or particions by hard skinnes, in every one whereof is contained eight, ten or twelve nuts lying orderly piled as it were one upon another, each of which are three square, some

whit long, and pointed more at one end then another, not formuch rugged as the outer shell nor so hard but they may be crakt with the teeth, some of them great ter then others, and all of them two or three inches in longth, and an inch and a halfe in thicknesse, the kernell: within being in talle not so like an Almond as a Walnut, more oily in a wet yeare then a dry, which the Indians by pricking fundry of them upon a flicke, and lighting of them, they will burne like a Torch to shew them their way, and continue long in burning, and give an Oily or Turpentine-like flame, having a blacke coale which turneth to ashes: The outer shell hereof is of the thicknesse of halfe an inch, containing within it a pint and a halfe of liquor Antwerpe measure, and weighed 17. ounces or more the emptie shell. The Indians feldome gather these fruites, but gather them after they are fallen, for they are afraid least they should fall upon their heads which were sufficient to beate out their braines, and when they are forced to passe them as in their warres, &c. they carry Bucklers over their heads to defend them. They make much account of these kernells, and use to eate them chiefly to provoke them to venery, whereunto they are too much proclive of themselves, and make it their chiefest felicitie having this proverbe with them Pignean [accnma pinge an Totocke, which is, Stambires veneremede Totockem. It groweth in high places and not in low grounds under the Line and on both sides thereof in the West Indies, and bearerh fruit twife every yeare, that

Totoche Americano five Amygdala Pericana Clafii forte. The Indian fruitfull Gourd bearing: Almond, or the Indian Almonds of Clafine.

Many other fruites, as well Melon like as Gourde like and others, are used by the Indians and the Christians like wise living there among them in some fort, but these here mentioned are the choisest and chiefest of them; I will now therefore lastly shew you fundry other sorts of fruits of trees that have medecinall qualities for the most part in them, and so finish this works.

CHAP. CXIII.

is, about Aprill and in November, and call it Totocke. It

is very probable that this is Clufius his Amydala Per-

vana, as any by comparing that little he hath delivered

thereof may foome determine.

Pinei nuclei Maluccani. Malucca Pine Kernells.

Ome Orchards in Mealabar as well as the wild woods doe nourieur) a certaine tree growing to the higgerfle of a Plane tree, whose leaves are softward trade of the darke greene on the upper side and pale underneath, tailing very sharpe and bitting upon the tongue for a good while, the fruite is of the bignesses of Filberd and triangular, divided on the inside into fundry partitions, contayning within them small white hard kernells, like unto the kernells of Pineapples, whereupon they have so called them, and which the Indians is as well in the cure of diseases, as to performe their wicked designes: they use to give two of these kernells, the skins that cover them being sinst taken away miscadup in a glister to purge and procure case to those that have the Sciatica of hip gont; & in the brooth of a Chicken to those that have their urine stopped or make it with paine, and to cante tough, slicke and cold tumours to be avoided a they give them like wife to those that are short, winded or have a cough, so which they much commend them and often file them being dissolved in water, and to the stop of the sody announced therewish and often file them being dissolved in water, and to the stop of the sody announced therewish does not being a firste viable of the sody announced therewish so the stop of the sody announced therewish contents to the sody announced therewish women and lighted single for the sody of th

Pinti Nuclei Ma'uccavi. Malucca Pine Kernels.

Mi

Monardus maketh mention of another kinde of purging Pine kernells, growing in Hispanisla, &c. within Lux let bi-fuch like cones but greater and longer, thinner field and blacker then the usuall fort, whose kernells being white and (weete-tempt divers to eate of them without suspition of evacuation, yet five or fix according to the ability of the parient being given in wine doe purge strongly both upwards and downewards, avoyding grosse humours especially: but being a little terrefied at the fire they worke not so violently or with such torments and gripings:

CHAP. CXIIII.

Penoabson. The Apple bearing pay sonous Almond tree.

Hevet theweth in his description of America, that in some parts thereof there groweth a tree, the barke whereof is of a strange and mervailous sent, having leaves like unto Purslane, very thick and alwayes greene : it beareth fruite as great as large filed Apples, and as round as an hand-ball which are not to be eaten for they are poylon: but they containe within them fix other fruits, very like unto Al-

monds but flatter and broader, each lying in a feverall cell, which are wonderfull profitable to the people, to heale their wounds by darts or otherwise in their warres, for out of these fruits they presse a kind of red oyle with which they are quickly cured.

CHAP. CXV.

Cacao five Cacavate. The Peare bearing wholfome Almond tree.

Enzoin his description of America, remembreth a tree growing in Nicarragne a Province of the West Indies somewhat like unto the last described, but because it is another fort you shall have the relation thereof as he setteth it downe. It is the fruite of a meane fised tree growing onely in warme and wet, yet shadowed places, and therefore must be defended from the fight of the Sunne by having a tall tree planted to the Sunne ward of it, which must be fitted and plashed that it may be as an Arbor

unto it or else it will wither and perish : the fruite doth somewhat nearely in forme refemble a Peare, or Peare fashioned Gourd, with a thicke shell or The Peare bearing wholsome Almond trees. rinde, and within lyeth an Almond like fruite, halfe as big againe as a Walnut, inclosed in a hard round shell, the kernell being blackish without, and brownish ashcoloured veines within, but bitterish and unpleasant, yet very fweete and pleasant to the Indians. After they have gathered the fruite they breake the outer rinde and lay the inner fruite upon Mars to dry in the Sunne, untill the moisture within them be consumed, and then they keepe them both for their meate and merchandise, for shippes loaden with them are carried from Gnatimale to new Spaine, and other places thereabouts, and trucke with them for other commodities in stead of mony, and give of them to the poore in stead of an almes. A drinke likewise the Indians make thereof called Chocolate, well pleasing and accepted with the greatest among them, who account nothing of more efteeme; but to the Christians, at the first it seemeth a wash fitter for hogs, yet by use even accepted by them also in the want of better.

CHAP. CXVI.

Areca five Faufet feu Avellana Indiana verficolor. The discolorred small Indian Nut.

His tree groweth great and very tall, but the wood thereof is spongy and not easie to breake, without any branches unto a great height, and towards the toppe spreading many faire branches, and leaves thereon greater and longer then the Coker Nur tree, the flowers are white without fent, and grow many together on a long flake hanging downewards from the lower branches, the fruit following on every one being longer but smaller, then the Nutmeg with all the outer rindes and shells, and hath the outer rinde covered with a yellow Cotton like silke, the

inner kernell being very like unto a Nutmer, formewhat round, and small at one end and flat at the other, with the like discoloured veines therein, but without any heate in talte or sent, and is therefore held to be cooling and drying: it groweth in study places of the Indies more or lesse plantissed in one or another place, and chiefly neare the Sea coasts: With the twigs served that are of two singers thicknesses. Natives use to hunt the Crocodils as well in the water as on land, for they can think these slicks that their abouthes sing are sure they cannot breake them, because they are so lightly and spongy, and thereby they doe retaine and take them, it is called Fanfel by the a stability, but some salles Fifel, by the chiefly influing savelly those of Gagarate, and Decan Supari, in Malabar Pac, in Malabar Pining Conclin Character is the presidently asked in all hot diseases, to helpe the tooth sch, and to salten looke teether the head or the looke primitive; the Indiana use this fraite abundantly eyther unripe to stupplies the head of the looke trips, being mixed with the seaso Betell or Betel inner kernell being very like unto a Nutmer, somewhat round, and small at one end and flat at the other, with the

Arcca vei finjel five Avellana ladiana ver ficolor.

Nun Faufetcum so in wollero et codem enempto.

Betre, the ribbes therein being first taken away, some put fundry other things to them, as Lycium, Campbire, Lignum Aloes and Ambegrife according to their qualities that take delight in it, which is generally through all the countries of India, with the chiefe persons most, and with the inferiour in some fort also, Garciae faith he distilled a water from them being fresh, which he used with good fuccesse in all hot or chollericke fluxes of the belly.

Areca fue Avellane Indica ver ficoloris genus oblengum Clufij.

A kind of small long discovered Indian Nut of Clufine. Clusius in his scholia upon the Fanfel of Garcias exhibiteth another kind of Areca or Faufel, whose kernells hath discoloured veines therein like a Nutmeg, or the former fort, and with a blacke covering over it. the chiefest difference from the other consisting in being longer then the other. Lobel supposeth it may be the kernell of a nat of his

Linschoten also saith that there is another fort of Areca which is smaller, blacker and harder then the former, and called by the Natives Checanina, which caufeth a lightnesse in the head.

Classes also relateth of another as large as a Walnut, with the outer greene rinde, but the shell was hard and smooth of a Chesnut colour. ong and pointed at both ends, flat on the one fide and bunching out

on the other, the kernell within being white and sweete. Another was about a finger long, and as thicke as two. flattifh on the lower end, and of a regged ash colour, the upper end being smooth and of a brownish colour, seeming like some small ticke, covered with a thicke hard shell, having a kernell within it.

Divers other fruits are mentioned by Cluftus and many others were have seene our selves, but because wee sloe not know any use of them or propertie in them, I rather forbeare their relating, then stuffe the Worke with unprofitable matter it being growne to voluminous already.

Areca five Avellana Indica verficoloris genus oblangum Clufi.

A kind of long (mall Indian discoloused Nut.

CHAP. CXVII.

Arbor Brafilia. The Braffill tree.

1644

He tree that beareth the Brassill wood which serveth the Dyers use, and to

which terveth the Dyers the, and to make Inke is a goodly faire great tree growing in divers places of the countrey of Braffil, and in no other place as it is thought, and the chiefest about Fernambuck from whence have rifen the appellations to the wood: the leaves wherewith it is cloathed are as imail as Box leaves, thicke and evergreene like them, the barke is of an aft colour, and the wood red, especially the core on heart thereof which is the best, and as it is said is no bigger then a mans heigh, though the tree be so bigge in com-passe that three men cannot fathome it. This as it is faid also beareth meither fruit mor gam, but I wonder then how so many could be found growing there? could the earth of it selfs thinke you without feede bring forth that aboundance? or will not time confume tham all? furely it cannot be but that it beareth feede, and is thereby propagated although not observed &c.

CHAP. CXVIII.

Arbor Triffin. The forrowfull tree.

dry tlender branches and faire leaves fet by couples on them, very like unto the large or great Myrtle leaves and finaller then those of the Plum tree, little or no-thing saipt about the edges, a little rough, and greene

on the upper fide and gray underneath: at each joynt with the leaves towards the ends of the branches on both fides come forth flender reddish yellow footstalkes wherewith they cofour their broths and means yellow like Saffron, bearing three or foure, or most flowers together thereon, composed of fundry small white leaves pointed at the ends, making a double flower, with divers (mall threds in the middle, finelling to tweet that they are thought to exceede eyther the Orrange or Islame flowers, whose propertie is inver so blow open in the day time, but in the night onely (when its time of flowring is) for fo foone as the Sunne thineth thereon in the morning, they all for the most part fall downe under the tree, and the whole tree with the branches seeme as withered and dead until the evening, eyther through the tendernesse of the stalke, or by a natural antipathy unto the Sunge, not to abide the shining face thereof, for some of the flowers does abide on these branches that are most shadowed from the Sunne : the following fruite they give is flat formewhat like a Lupine with a thicke skinne, (it must be but small store, for what quantitie of fruite canthis tree beare if all or the most of the flowers doe fall away) yet heart fashion, and of a greenish ash colour, with a division in the middle, in each part whereof is contained small flat beanes or kernells, like unto those of the sweet beane or Carob tree, heart fashion likewife, and covered with a greenish skinne or pec-ling, the inner kernell being white and somewhat bitter. This tree hath been much defired to be transplanted into our Christian world, but as fome have fayd it would not abide, not withftending all the care of earthen and woodden vessells, wherein it was planted to be

He tree that beareth this name from the properties rifeth to be a reasonable tall, spreading sun-Arber Triffis. The forrowfull tree.

brought into Spains or Portugall, neither ever would the feede spring as it is affirmed, but I have lately underthood by a catalogue of the Plants growing in the garden of Signor Corvins of Rome that it groweth there, being one of the plantsnamed therein, it plentifully groweth in Malabar and brought thence to Gos, and fundry other places of the Indies, where every branch being put into the ground will take roote and grow. It is called in Malabar Mogli, in Malayo Singadi, in Decan Pul, of the Arabians Guare, of the Persians and Turkes Gul, but at God and Canarin Parizataco from a certaine Nobleman to called (as the Natives thinke and therein very neare intimating one of Ovids fabulous metamorpholis) whole faire daughter the Sun having elpyed fell in love withall, and having deflowred her & forfaken, for another, the flew her felfestrom whose ashes of her but nt carkiffe rose up this tree, which is ever fince assamed to behold the face of the Sunne. In many places of the Indies they distill the slowers for their sweet sent sake, and keepe it for use; which in Malabar they call the water of Mogli after the trees name : the faid water is good for fore eyes to coole their heate and rednesse, if lianen cloathes being dipped therein be layd upon them : the Indian Philitions doe hold opinion that both flowers and fruite doe comfort the heart, and refresh the fainting spirits thereof, for they have some bitternesse in them, it hath not beene observed that the Indians apply this tree to any other use then is formerly expressed, and the colouring of their meanes like as Saffi on is used for the same purpole in Spaine and other countries.

CHAP. CXIX.

Arbor folys ambulantibus. Walking leaves.

Earë unto the Ile of Cimbubon and in the Ile it felfe, there groweth a tree bearing leaves like unto those of the Mulberry tree, having two small short and prickly feete as it were set on evther fide of them, which falling to the ground doe feeme as it were to creepe as if it were fome living creature, and being touched by any will presently move it selfe. Master Anthony Pigafeera faith that he kept one of these leaves in a continuall motion in a platter for eight dayes (the motion whereof is likely to come by the ayre) and then it ceased.

CHAP. CXX.

Arber aquam fundens. The fountaine tree of water.

None of the Hands of the Canaries called Ferro, there groweth a reasonable great but faire spread tree bearing leaves like unto Wallnut tree leaves but larger, abiding thereon and ever greene: it beareth fruite like unto an Ackorne hanging downe from the branches, which hath a kernell within of a very pleasant taste and almost like spice. In some parts of the world besides are found the like tree, the

leaves whereof and branches doe perpetually droppe water (in the whole lland there being no other water to be had) a thicke mist as it were or cloud encompawng it continually, a checke mist as it were or cloud encompawng it continually, a which water to be had) being kept as it were in a fountaine made for the purpose to retaine it, serveth the whole Iland for their use. Our Countrey man Master Lews Iackfon dwelling in Holburne, told Master Purches as he hath set it downe in his seventh booke of Pilgriranges Fol. 1639, that in the yeare 1618, he had beene in the faid lland Forre, and had feene that tree, and faith it is as bigge as an Oake of a middle fize, the barke white like Hardbeame, fix or feven yards high with ragged boughes, the leafe like that of of the Bay, white underneath and green above it beareth neither fruit nor flower; thus faith he, but it hath some other different relations which who so would see, let them reade the place before recited: the llanders call this tree Garee, the Spaniards Arbor Santia : but the ancient Historians call it Til. It is thought that Solimus and Pliny in his lib. 6.c. 32. meant this Iland under the name of Ombrion and Pluviali, for hee there faith that in the Iland Ombries grow trees like unto Fernia from whence water is wronge out, from the blacke ones commeth bitter water water, and from the white that which is fweete and pleafant to drinke.

I might here infert the Barnacle tree but that it is found to be a fable, and that the Geele hatch their young as other Birds and fowles doe, and therefore I forbeare to speake of it.

CHAP. CXXI.

1646 CHAP.121.

Ouercus natalisius Di virens. The Christide greene Oake.

Note new Forrest in Hampshiere neare a place called the Casse of Malmood groweth an old great doating Oake, which by the relation of the neare Villagers, is alwayes observed to shoot forth fresh but small greene leaves every yeare a little before Christide, which abide not long thereon after that time, but fall away, others springing out in the due time that other Oakes doe, bearing both leaves and fruit as usually other Oakes doe in their season. King Issues in his time understanding of this tree, went and saw it, and caused it to be paled about and benches made thereat, both for people to

fit and contemplate the wondrous workes of God therein, and to keepe unruly persons from breaking and spoyling it:but(mitimar inveitium semper) the more it was intended to be preserved, the more wisfull people were bent to breake and spoyle it (being the more famoused by that provision) and breake downe the pales and carry them away. I have had both leaves and Ackornes brought me from this tree, taken by Master John Goodier each in their scason.

CHAP. CXXII.

Arbor Venereos fimulos domans. The Chaste making tree.

Ferrir de Osna in his letter to Monardiu maketh mention of a certaine tree growing there in the West Indies whose camber was a spongie substance whereof the Indians would never take a sticke to burne, neither by any me nes, although they were treatned to death could be brought to burne it or ever the smoake onely touched, was made utterly impotent and unabled to any venereous acts.

CHAP. CXXIII.

Ome that accompanied Sir Francis Drake in compating the whole world did relate that in the Hand of Ternate, which is neare the Equinoctial line, towards the North pole groweth a firange kinde of tree about ten foot high, whole topic is formed like unto i Cabbidge, in the middle whereof is found a fine white meale which the poore Handers gather, and by putting a little water thereto and letting it ferment they make palt or dough, whethed they make thinne flat foure Cakes, and bake them in certain long earthen pans, with fire put round about them which they ease while they are hot, for when they are growne older and hard, they force them in warme water and bring them to a kindle of pultage and so ease them, but this Cakes or bread is in a manner without rafte or relifit, but when some Pepper or Cinamon with Sngar is put thereto, it is a pleasant food to many, but March Folm Pursent recorded it a mister strange bread tree growing in the kingdome of Fanfar, whole trunke two men could scarse fadome, the thicket whereof being thicke, and taken away, the wood thereof about three inches thicke in compasse is as hard as Iroh being so heavy that it sinketh instantly in water, whereof the natives make them short pikes or speare, sharpening and burning them at the end, so that they will be able to pearce Armoir thirthe whole middle of this tree is soft like unto a meale, which putting in water and stiring it to take away all the drosse that Cwimmieth above, I is foft like unto a meale, which putting in water and fliring it to take away all the droffe that fwimmeth above, they mould up the refidence into cakes, and divers other forts of visites fit to be eaten, and whereof as hee faith he brought fome with him to Venice.

CHAPS GXXIIII.

Arber five Palma faccifera. The Bagge bearing Nurrece!

Ertaine Dutch Marriners having by a casualtie lost their shippe, wherein they with others were saying to the West Indies, in their returne home, in their shippe boate lighted on a desart lland called Coronopez, wherein they found whole woods full of these kindes of strange trees, and others growing among them whose fruits being round Nuts, as bigge as Wallauts with their greene outer shell, and within them other smaller Nuts so round as a ball, and with so hard a shell, yet not very thicke that they could hardly be broken with an Iron hammer, and a white hollow kernell in the middle

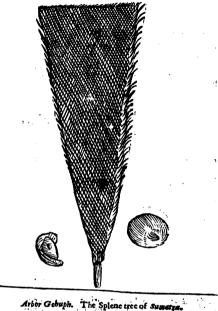

talting like Peafe at the first, but a little bitter afterwards, like a Lupine, were inclosed in a long sheathe or hollow hole, retembling an Hipocras or Syrupe bagge, some being twenty two inches long, others two foot and a halfe long, yet all being very finall at the end and growing larger up to the toppe, where they were about feven inches wide, and composed of a number of brownish threds or haires dispersed all over the case, some running at the length and some croffewise by a wonderfull worke of na-

CHAP, CXXV.

Arbor metrofideros. The Iron hearted tree.

Califer maketh mention of a certaine small treeis reported to grow in the Ile of lava major, whose heart or core is as impenitrable as Iron, from the bottome to the toppe : and the fruit which it beareth is likewise as hard, but the report faith he, is of so little credit and so neare a falsitie, as I am from beleeving it : yet Nicholans Costinus in his Iournall doth seport the famething.

THE THE CHAP. CXXVIII SECRETARY

Arbor Gehuph. The Spient tree of Sumatra.

N the He of Sumstra anciently called Trapobama or Tagrobana is Thever relateth it groweth a
tree not very genericalled there Gebaph, and is
the Indice Gebban whole leaves are many final
cours fet on a ribiogether, formewhat like unto the Caffia
foliation, or purging Caffia leaves, fet on fhort branches
covered with a yellowish baries the finit is somewhat
thinks and as round as a ball, where under is contained a
Naz as big as a hatel Nut, with a very bitter kernel with
imit, yet talting like in Amedican revery hit of kernel
con contained a like in the parket which they aske for eight
done in the difference of the Liver and Spicene, wherewith they are much afflicted and therefore draw an oyle
con of the kernella of the Nutt, which they aske for eight
done or rogenhey in which they take the region
done of the bitternelle take it so willingly, as women and
children, it is appointed thin them to be annointed with
the oyle on the belly, back hose and sides, which worketh
the cure alike the said oyle is in such the with them also,
and of great account for the singular helps and remedy it
giveth to all juyin aches, gouts and the like a the gum
likewise of the tree being dissolved with a little oyle and
spread plaster whe is applyed to the grieved places with
good effect. The inhabitants doe plant this dreeness their
Honses in their Orchards and Gardens for to have the benefit thereof nigh at hand. N the He of Sumstra anciently called Trapobanefit thereof nigh at hand.

CHAP.

CHAR. CXXVII.

Beretinus fructus. The Beretine Ackorne.

By Lusius in his second booke of Exoticks and seventeenth Chapter, maketh mention that he obtained some of thele fruite; from those that accompanied Sir Francis Drake in his Circumnavigation of the world returning in the yeare 1, 80, by the meanes of some of his friends here as

Mafter Garth and Mafter Morgan, which were affirmed to be gathered in some Islands (whereinto they put both for fruit and victual standing in neede of both) from very great and tall trees bigger then Oakes, whose leaves were like unto Bay leaves, not dented at all about the edges but thicke and thining a the fruit were like the Ackornes of the Ilex or evergreene Oake, but without any cup, for as hee faith he enquired thereof of some of them, whose outer rinde was thinne and of an ashcolour, and some blackish, the inner kernell being somewhat long and white, without any manifest taste within but covered with a thinne skinne, which they found good to be eaten without any harme following, and therefore in their want being taught by the Handers they boyled them like Pulse or Pease, and so eate them or beate them to pouther and boiled them like Rice or Wheat, untill it became a pultage and so eate them for hunger: yet afterwards they found the like trees and fruit to grow in the Islands of the Moluccas as they affirmed: But with what other properties they were indued, neyther they nor any other hath manifested to any that I know.

CHAP. CXXVIII.

Vhebebason. The Indian Hony tree.

branches to uniformely, that it is a great pleasure to behold, in that they seeme having leaves on them like to Coleworts, (which I beleeve is mistaken, the figure not expressing such a forme) and fruit of a foot long. In the hollow parts of this tree above other, the Bees doe make their Hony and Wax, whereof the naturalls make much account for with it they feafon their foods made of roots, &c. Vato this tree resorteth familiarly a certaine bealt somewhat like a Cat, but of a browne colour, called by them Heyrat that is the Hony beaft to feed on the the honey, which it carefully pulleth out with the feete without hurting the Bees or being stung or hurt by them.

Hevet maketh mention of this tree among his other American fingularities to be very tall, foreading the Thelele for. The Indian Honytree.

The Theater of Plants.

CHAP. CXXIX.

Proma infama que Muces infame a Clufio dicuntur. Mad Indian Plums or Nuts.

His Indian fruit mentioned by Classes in second booke of Exoticks, page 53. and 54. is thus related by him. The Deich after much wandling in the anknowne Seas fell by chance into a certaine Bry Leitnice in 11. degrees 45. minutes of Northerly Latitude where they found certaine trees as big as Lerty trees, with long and narrow leaves like Peach leaves, whose fruits they saw the Monkies there eating, when poin divers of them gathered some and caute them, which were fully round, growing for the most part singly each upon in stalks, and sometimes

Pruse in some a Country of Stalks.

ing for the most part fingly each upon its falke, and fometimes two together, being about awe inches or not much more either longwife or round, with a firme but not very thicke shell, brownish on the outside and not very smooth, but smooth within, and of abrighter colour, consaining a tertaine fruit within somewhat he unto a backer Slock. Both for forme and fize, spotted with somewhat a large white spot at the bottome where it shood upon the salke, having a stone under that Plum which was grayish and slard, and a kernell with it, those persons which had caren of these Plums stells no harme, but some of the commany steening both somewhat energies and carells and care lost in the stone of the commany steening both somewhat energies and carells and care company steeping both stones and kernells, and boyling and eating of them fell into divers distemperatures, according to each mans feverall humour, one thought his Cabin was made a Brew-house, and bad take away the woman that was there; another called his Mates together, asking them if they would buy his fish, whereof he had varietie a another lying in his Cabin com-

Prona in fara que Nuces infana a Ciufto dicuntur. Indian Plums of Nuts.

plained that his flesh was torne from his bones, another cryed out loudly that they were building a great ship in his Cabin, another in his Cabin broke foure or five Chinay dishes, saying that many men were comming to take away his Cabin from him, another calling to the Mailter of the shippe said, doe yee not fee the Divell sitting in the Sterne catching Fish; another sayd that he saw the Anchors in the bottome of the Sea through the bulke of the Shippe; the Masters some said to his sather. O my father I see a number of little men running upon your note, but after they had flept all these imaginations vanished, yet some of them slept for a day and a halfe, and fome two whole dayes before they waked, and fome thereby were troubled with the laske a many other fancies fell among the rest which were too long to recite; but among them all said he as it were in scotne among the rest there was an English man distracted, who looking upward said he saw the heavens open and cryed with a loud voyce, O Lord I will willingly follow thee, and with divers other gestures moved the company to laughter. Clusium sheweth that in the same table with these Plums or Nuts hoe set another small Nut not much anlike an Hafell nut which made no noyfe of any kernell therein, and knew not whether it had any cup to hold it as an Acknorne hath or no.

CHAP. CXXX.

Mamoera mas & femina. The male and female Dugge tree.

He forme of their two forts of tres are both alike, not differing the one from the other, but in this that the male beareth no blossomes, but fruite like unto a final Pompion many growing toge-ther towards the toppe out of the bo-

dy of the tree which hath no armes or branches but onely large broad leaves much like unto the Plane tree or Maple tree leafe, each franding on a very long flalke; the trunke or flocke of the tree is neafe two foot thicke, and about nine foote high: the flowers are of a pale yellow colour like unto Elder bloffomes which ferve to no use, the fruit is round and fleshy. yellowish when it is ripe, and serving them to looien the belly when they are eaten and conteine within them many round blacke thining graines as bigge as Peafe which likewife are put to no ule with them. The propertie of thefetrees is faid to be, that unleffe the male kinde bee planted to grow neare the female it will beare no fruit at all; of which nature a kinde of Date tree is faid to be also. This tree growers in that part of Brafil that the Portugalis called Baya he todos Mamoera mas & famina. The male Dugge tree.

1650

CHAP. CXXXI.

Moringa. The Bezar tree.

His tree groweth not great, nor spreadeth with many branches, but is like unto the Lentiske or Masticke tree both for greatneile and leaves, being full of knots, very casie to be broken, of a very faire but sad greene colour and of the tafte of Turnip leaves a the fruit is a foot long, and of the bignesse of a Reddish root having eight edges or corners of a greenish ashcolour with a white substance within devided into certaine cells wherein lye imail round feede like unto fimall Pease but greene and tender, and of a sharper taste then the leaves: the whole fruit fliced in peeces is boyled in the broth of flesh and fundry other wayes. But the roote of this tree is a foveraigne Antidote or Counterpoilon, as effectuall as Vnicornes horne or Bezar stone or any Treakle, for the natives docusinally take thereof, both against all kindes of poisons and the bitings of the most venomous creatures, yea even that serpent which the Portugalls call Culebras de capillo, which is accounted the most dangerous of all, taking thereof both inwardly and applying it to the outward place. They have found it also to bee singular good against the winde chollick, and to be no lesse effectuall against the Leprose, for many have beene thereof cured by often using of it, it is mixed also with those medecines that purge melancholy. It groweth plentifully in all the Province of Malabar. where they bring the fruit into the market to fell as beanes and peafe or eliewhere. The Arabians and Turkes call it Morian, the Persians Tame, but they of G azzerate Turiaa.

CHAP. CXXXII.

Negundo mas & famina. The male and female wound tree.

He Indians make two forts hereof, the one they call Varolo Nigundo, that is, the male, and the other Niergundo the female, in Mala-

but Noche, in Balagate Sambali, in Decan Beche, and to also by the Persians and Arabians,
but Air by the Inrkes, and Noreila by the Portugalis: these trees are of much esteeme in the province of Malabar, and of so frequent use with all forts of people, for all their griefes and dileales, that if they were not great increalers, and that every branch thrust into the ground will take roote and grow, they had beene wholly confumed or growne to fearle that they would have beene at an exceeding great price. The male groweth like the Almond tree with rough leaves like unto Sage, greene above and hoary underneath, and dented about the edges, somewhat resembling Elder leaves a farre of. The semale kind groweth greater and hath larger and rounder leaves, refembling those of the white Poplar tree and not dented about the edges: the leaves of both forts smell and taste like Sage, but yet are more sharpe and bitter, many of them having a white froth on the backside of them, comming on them in the night: the flowers of both are of a pale blew or ashcolour much like unto those of Rosemary : the fruit of both likewise is like unto blacke Pepper but nothing fo fharpe and hot as Pepper comming nearer unto the talte of Ginger. Both leaves flowers and fruit bruifed and boyled in water or oyle are usually applyed to

all difeafes by the vulgar fort, but especially to all Joynt aches, tumours and contusions proceeding from any hot cause, and that with singular good effect : the leaves also bruised and laid upon old Vicers doth wondrously helpe to digest the matter, clearle them and bring them to cicatrifing, so as the body be not foule but prepared and purged before hand. And certainly they are found to available in all wounds, Impostumes and bruises, that the people using these seeks for no Chirurgian. The women use to wash their whole bodies with the decoction of thele leaves at all times and seasons, and are so perswaded of their effect to helpe them to conceive children. that they that should goe about to perswade them the contrary they would stone them to death,

CHAP. CXXXIII.

Nimbo. Another healing or wound tree.

His other tree is more rare and scarse then the last, called by those of the countries in India where it is knowne Nimbo, but by these of Malabar Bepole, and is of much account both with the Christians there and Gentiles. It is as bigge as an Ash, whereunto a farre-off it is very like, the leaves are very greene on both fides, dented about the edges and pointed at the ends, it is plentifully flored with both leaves and flowers which are small and white, with five leaves apeece and some yellow threads in the middle, and of the fmell of the Trifolium odoratum, fweet Trefoile, after which the fruit appeareth which are like unto small Ollives with a yellow thin skinne. The leaves are somewhat bitter, but very wholesome being bruifed and mixed with a little jnice of Lemons, & dropped into foule Vicers or those that are hollow or fiftulous or with hard skins therein ey-ther of man or beat, doth helpe them by digetting, clenting healing and skinning thems the juice of the leaves is a most familiar and knowneremedy in Malabarto kill the wormes of all forts in the body, whereunto they are much subject, whether taken alone or with other things for the purpose into the body, or used outwardly to the Navelle the flowers & fruit also are much used against the gout and the paines, swellings, weakenesse and impostumations of the joynts or parts, the Oyle likewife preffed out of the fruit is fingular good in the paines and greefes of the finewes, and therewith doe those of Malabar cure both wounds in the flesh, punctures and pricking of the Nerves and Sinewes, and contractions or distortions of the members.

TRIBEIT.

Ninhe. Another healing or wound tree.

CHAP. CXXXIIII.

Hypomrabe. The Americans vice Guajacum.

His tree is very tall having a barke of a whitish silverlike colour, but the wood is reddish under it of a little brackish or salt sweet taste, resembling the wooddy part of Liceria e it beareth fruite of the bignesse of a meane Plum, and of a good yellow colour, with a kernell within it, of a most sweet and delicate tafte : bur which maketh it the more wonderfull, so feldome bearing fruit that as it is faid, man in his life time shall scarfe see the fruit above foure or five times on the tree, being sisteene yeares betweene one and the others bearing. The barke of this tree is of a wonderfull vertue and effect in curing the Indian (which one and the others bearing. The barke of this tree is of a wonderfull vertue and effect in curing the Indian (which we call the French) differie and is of the fame account with the Indians where it groweth that Guajacum is with us, and while it is diefin the too peeled from their ee giveth a white milke, this barke being cut in flices, they boyle in water three of four hours until it become of a Claret wind colour, which decoction they drinke for fifteene or twentie dayes together, using in the means time a spare diet, by which means they are not onely cured of that disease but obsayother that proceeded to delid and flegmaticke humours: the kernell of the fruit is much used by the fick whose appetite is lost to quicken it and get it agains. Neare all the coasts of the continent faith Mongradus is gathered by the Indian a certaine white liquor like milke taken from the branches, and small Apple like the states being wounded, which they call Pinipinichi, which some groweth thicke, and is somewhat clammy, three or some dayons whereof being taken nurseth very violently being raken in wines, but if some findle is a worke above foure drops whereof being taken purgeth very violently being taken in wine; but if any finde it to worke above their strength or defire, by taking eyther a little broth, wine or other drinke, it stayeth the working presently.

CHAP. CXXXV.

Achanaca Treveti. The blacke Moores Guajacum.

chiefly in the privie members which in men is called Afab, in women Afabates, the ditease it selfe Borozail or Zail : but by the skill of the Philitions of whom they have many, and skilfull in their profession called Biarins, they have found our growing with them an herbe of affured helpe and remedy therefore, which groweth up with a great stalke as bigge as a mans legge, and many great leaves thereon, cut in or jagged on both edges, somewhat resembling a Colewort lease, but nothing so thicke eyther in the lease or middle ribbe and double pointed at the end, from among whom groweth the fruit, of the bigneffe of an egge, and of a yellow colour, which they call Affard, the decoction of this herbe above all others, although they use divers, is of sufficient validitie to cure it, for they have no other Guajacum for their helpe, and therefore use this in stead thereof.

CHAP. CXXXVI.

Winteranin cortex. Captaine Winters Cinamon.

Apraine William Winter that in a shippe by himselse accompanied Sir Francis Drake in part of his voyage over the whole world, but left him at the Straights of Nagellan returning from thence home into

England againe in the yeare 1579. in the parts theresbouts tut downe certaine trees, whosebarke was somewhat like

unto the thicker fort of Cinamon, both for substance and colour, yet for the most part thicker, and some of it of an ash colour, and some brownish on the outside and rugged like Elme barke, fome of it having chinkes or riftes on the infide, and fome smooth and firme, of a fme I not unpleasant, but of a very sharpe tafte like many spices rogether, heating the mouth more then Pepper, the leafe of the tree is of a whitish greene, not unlike the Aspen leafe, the berries grow in clusters like the Hawthorne, with divers seedes in each of them. They at the first knew not of any properties therein, and therefore boyled some of it in hony, to make it the more pleafant to be taken and dryed other force and made it into pouther, putting it in flead of Cinamon in their meats : but afterwards they found it to be fingular good against the Scurvey, for divers in the shippe being troubled with that disease found remedy thereby in using it a while. Some of our company of Apothecaries, and those not of the meanest doe use to call the Canella alba mentioned there before Corren VVinterani, and have used it in their dispenfation of Mithridatium as a substitute for Coffm, whereof I gave you a touch in the Classis of Cardai and Spinofe, in the last Chapter thereof fave one, But now by comparing the one with the other you may eafily fee the errour, for the Canella albais a white harke, rowled like Cinamon, and not much thicker then it,

of an hot tafte but neither like Cinamon nor Pepper, and this Cortex Winteranne is thicker then the thickeft (inamon, not caste intorowles or hollow pipes like it, and tasting much quicker, besides the colour is of a duskie browne in most comming nearest unto Cinamon, I thought good a little to explaine this matter here, because I finde many possessed to throughy with this person that Canada at the Contract printer and, that all may see how true their opinion is. This barke might feeme to be that whereof Monardin faith he had a peece from Bernarding de Barge an Abotheoury, burchat his had a more excellent finell and talket excelling this of the Numer, and as plea-fant as Cingmon, and more cordiall, which is not found in this barket of Finders, Monards like wife maken mention of shother thicke barke which was taken from tree as great as an Elme and like in forme, growing fearle in anycother part of the West Indies, then neare the Rivers sides about 150 leagues distant from Lima : it is hot faith he aboveche fecond degreenthe Indians uferto put ir up inso their potrults, the fine pourter of the barke when they are troubled with theumes and deflaxions from the braines or with other paines in the head, for it

CHAP. CXXXVII.

Corn arbor. The collive or binding tree.

His tree is somewhat like unto a dwarfe Orrenge tree Both for forme and leafe, but having a thicker middle ribbe and eight or nine other imaller ones running to the fides : the flower is yellow with. out fent, the barke of the roote onely is inuse which is of a pale greene colour, and being broken yeeldeth much milke, which is somewhat claumy, having little taste, but some bitternesse; & is more drying then cooling. The juice or milke of the barke of the rootes hereof, although unpleafant is much used by the natives of China, Iapan, Malaca and Bengala as well as Christians in all manner of Fluxes and Laskes comming from what cause soever, Those of Canarin call it Corn, they of Malabar Curo and Curo dapala, and the Brachmenes Cura.

CHAP. CXXXVIII.

Pavate. Another Costive tree.

His other tree which is more frequent to be had then the last, and called Pavate in Malabar is therefore in more use though not altogether of so frong and speedy effect, for the staying of Laskes and Pavate. Anorher Cuffive tree.

Fluxes,but is of excellent propertie to coole all hot inflammations, and eruptions of cho-

plentifully draweth downe humors whereby they finde cafe, see and

a special Canada and a grant Calas to the classic and north

lericke matter in the skinne and S. Anthomies fire : the roote of this tree is of chiefest use, and sometimes the wood steeped in the decoction of Rice, which will grow sower after it hath stood a few houres, and then they call it Cania, with this decoction they walh also the oneward parts inflamed or spotted which coolethmuch, and helpeth all those heates : it is also drunke being Reeped as aforefaid against the heate of the Liver, and in hot Fevera a few leaves of Tamarinds being put thereto they u'e to wall the fides of Vicers and wounds that are inflamed, and have defluxions of humours to them to flay the Flux and coole the heate. The tree is not greater then the Figure and coole the neate. The free is not greater then the former, having but few branches and fuch like leaves of the Ortenge but without that fmall leafe underneath it, and of a fresh greene colour the flowers are whittin like unto the Hony fuckle with small round blackish seede likeunto those of the Malticke tree: the barke is of an Ashcolour, and the root white. The Brackness and those of Canarin call it Vafaveli, the Portugalls Arbol contra las erif polas.

CHAP. CXXXIX.

Pacal. The Tetter tree.

His tree groweth neare the Rivers fides in the Wellndies, part whereof being fent to Monarday had this commendations that the ashes of the wood mixed with a little Sope, the Indians used to annoint on those places that had Tetters, Ring-Wormes or the fowlest spreading Vicers, and scarres that could be, either in the head or any other part of the body to cure them and leave the place faire againe.

CHAP. C XLII.

Liguum Celubrinum, Snake wood.

Here are divers forces of Snake woods, Acollo bath let forth two or three, that he knew used by the

Indians against the bitings of Vipers, Water Snakes, or the like Screens, and yet as Clufin faith none of those agreeth with these that Garcian maketh mention of, Baubinian calleth them all Clematin Indica. The field of Garcias is rather a roote then a wood, and groweth with foure or five flender Garcias pris branches, about two loote high, the leaves are like Peach leaves, but more finning, the flowers grow me many together on a long stalke in clusters, of a brave red colour, the berries are like those of the Elder, clustering together, and red and hard. The roote, which is most in use, is full of knots or heads, growing above ground, with many small strings under them, being of a whitish ash-colour, and of a strine substance, with a little birter-nesse in the taste: it is called by the Inhabitants Lametal, and by the Porragals P as da cobra, that is Snakewood: This roote being beaten into pouther i given in wine or some cordials water to those that are bitten by any Serpent, and likewife raketh away (pots and pushes, or wheales, or other freeting fores in the skinne, and is held to be good against that cruell distate, which they call Morderi, and some take to be Plague, or other dangerous infections difeafe, and some call it the Chollericke passion, it is held also to be good against agues, an ounce thereof bruifed and fleeped in water, purging much choller by comit. His fetond for its he faith when it standeth Servadum alone, groweth to be a tree, and is like the Pomegarnet tree, fet with thicke, short, and the thinke, the tree of a white tish thicke and firme barke, full of rifts, and a little bitter, but not fo much as the former, the leaves are of a yellowish greene colour, very pleasant to behold t but if it grow by any other tree, it will clime thereon by the branches unto the toppelike a Gourd: they ale to give both the wood and the barke hereof, but effectally the roots in the fame manner aforefaid, and for the faid purpofes: it growth in the life of God. His third fort was Terriman brought to the Vice Roy, in certains small bundles of wood with their rootes to them, being slender, hard, blacke and tweete finelling, which rootes they of Islans pates, being an life nigh unto Zeilan, did wonderfully commend against venome or poylon. It groweth up with a few flender branches, foure or five cubits long, which commend against venome or poyson. It groweth up with a few slender branches, source or five cubits long which if they be not tyed or held up will lye on the ground, having a few thinne long leaves like unto those of the Maclicke tree for the forme, yet not greene but sported, with whitish blacke markes upon them. The first of these is Greene said, was found to be effectuall against the venome of those virulent Serpenus, by this meaner. They have there breeding with them, a certaine small beast, as great as a Ferret, which they call Quillot Quirpole, being a deadly enemy unto the Serpent Regulus, with whom when soever it sightenth, it eateth of the beads of one of those rootes, that is bare above ground, which having chewed, he cattest his spirit upon his head, and over the reft of his body, and his fore feet alfo, and then fighteth with that ferpent, and will not leave it untill he have

they dance.

killed it. Many Portugalli at feverall times have beene eye witneffes to thefe battels : for they not onely keepe this small creature in their houses, to sport themselves with these combates, but to kill their Mice, Whom they most eagerly hunt and kill. There are also certains wandring beggers called Jogues who doe often carry about with them these serpents Regular tame, making men believe they have enchanted them, and some likewite that are fierce, whom for a reward they will suffer these Ferret-like beasts to fight with.

Lignum Colubrium primum Acofte. Acosta his first Snake wood.

The first fort of Snake wood that Acofta maketh mention of, groweth in Malsbar formewhat after the manner of Ivy, spotted like unto the stalke of Dragons, and so like unto a serpent, that he that should see it at the first. or 197, sported sixe unto the static of Dragons, and to sixe unto a serpent, that ne that including the state first, not having seene it before, would take it for a very serpent, especially beholding it in the Moone light. The first leaves it hath are broad, and whole without any cut or devision on the edge, but those that come after are like all most unto Bryony leaves with aribbe in the middle of them, and five or six others, running from thence to the edges, and lastly some cut into divisions like a Vine leafe, all these forts of leaves being to be seene at one time on the stemmes and branches, that they would seeme not to be the leaves of one and the same plant : This wood is held to be the most soveraigne remedy against the venome of all forts of serpents wherewith they abound that by the onely fent thereof, carrying it continually about them, the ferpents wherewith they walke in the fields, and if they doe touch any of them therewith, it will make them to breake in peeces and dye.

Lighum Colubrium feandum Acofte. Aboft his fecond Snake wood.

Another fort groweth low and small thaving onely three leaves fer together, which are fost, long, and narrow, the state of the

fmooth, and of a darke greene colour, it hath not beene knowne to beare either flower or fruite; the roote is long and stender, smaller then ones little finger, running along under the surface of the ground, and knotted in divers places, the outer rinde being very thin and of an afti-colour, having at the first little or no taste therein at all, but after a while it yeeldeth a fine sent and taste like Muske, this barke chappeth in many places, she wing under it another thicker, and yellow, of the fent of Trifolium odoraram, Sweete Trefoile, and talking sweete like Licoris. but not abiding long, the Subtance whereof is wooddy; and called in Caparin, Dada Sali: this roote being beaten into pouther and taken in Wine or Water is faid to be a certaine and prefent remedy against the bi ings and venome of any serpent whatsoever: it is much used likewise in terrian and day agues, the weakenesse of the florracke, the trembling and passions of the heart, or swounings, and against all forts or paysons a many have affirmed that no ferpent had power to doe him harme that but held it in his hand, and that the fight thereof would make the ferpents flye from it to some other place: it is held also to be good for those that have slinking breathes, or have slinking four hollow teeth that give an evill favour, to hold it in their mouthes, or to put it into the hol-

A third fort is found in the same Provinces, and is a tree of a very large fize and greatnesse, whereof peradventure that was a peece that Cluftus faith he had of Doctor Heller Numer; the Portugal Phylition here at London; the wood being like a peece of Ash, firme or close, with certaine veines running therein, the rindo or outer barke

being of a whitish ash-colour, and tasting somewhat bitter.

Cohyne. The Indians rattling God.

CHAP. 143

. 1566

He Portugals pollelle a certain Country in America, cilled Morpian, which is ful of very good fruits, and among the rest the Nana or Pinas. There is allogrow-

ing a tree whose fruite they call Cobyne, having leaves like to thote of the Bay trespand fruit as bigge as a Melon, formed like unto an Estridge egge, which although it is not caten by any of them yet is very beautifull hanging on the tree The Savages use to make drinking cuppes of them, burbe-fides that they commit Idola ry there with, which is wonderfulland to be lamented, for having emptyed and made hollow these fruites, they fill them with the feedes of Miliam or fome other thing, which being shaken with ones hand, or with the winde, will make a noyfe: then doe they fasten a pole into the ground, and sticke this fruite full of those seede on the coppe thereof, and fallen about it the most beautifull feathers of birdes they can get; Every house is th two or three of these sruits decked up in this manner flicking on the poles, which they have in gleat reverence, thinking some god to be in them, because when they are shaken they make a noyse and their pricits and prophers make them belocyclicit God, whom they call Tonpan, speaketh and tellette them. Whether they should doe, and what shall come to the should be and the spectrobe found that they worship any other things. Clustum faith that this fruite is called Maraka, and Camarake; but I thinke these names smell somewat of a

Greeke Godfather, as the Ta malabatira from Tamalapatra: yet others fay they are their hand rattles wherewith

CHAP. CXLIV.

Palma Hairi. The thorny American Palme tree.

His nee groweth in some parts of America, both in shape of body and leaves like unto the Date tree, but full of tharpe thornes, Bl bearing fruite as bigge as an handball, but pointed at one end, having within it a fine inow white ker-

nell; the wood of this tree is as blacke as blacke marble, and fincketh in water, because of the heavinesse, and therefore some have thought it to be Ebony, but Thever contra-dictern that opinion with these reasons: first that Boony is a wood more blacke or filling, and then that Ebony bearers no thornes, and lafly; Thony is not found in America, but in Athlopia, and the East Indies; about Cakens, do the indians of this wood make them (words, which) for the maffinelic give a mighty blows and will breake both full and bones, where it lightesh on any although it doth not cut as our fwords doe : they make allolarrowes of them, which by rea-fon of their hardnesse like iron, and the points of them burned, to make them fo penitrable, that they will be able to pierce a good corfelet.

Palma Hairi The thorny American Palme tree.

CHAP. CXLV.

Palma scriptoria & aliz arbores, cuju folia & cortices charte vicem prabent. The writing Palme tree and fundry others, whose leaves and barkes have supplyed the office and want of Paper.

Greeke

Here are fundry forts of trees growing both in the East and West Indies (although none of the Nations of the West Indians, except the Mexicanes know any use of writing or Letters, before the Spaniards first entrance among them, but the Spaniards there made use of divers in the want of paper) whose leaves and barkes have beene used to write on (besides the ancient paper want or paper) whole leaves and Darkes have of the united on (beinges the anticent paper Reed, which ferved the former Greekes and Latines to that purpose for many ages, whereof Palmeta Reed, which served the former Greekes and Gailandinas as largely commented upon him, and whereof I Palmeta Pliny hath largely interacted, and Gailandinas as largely commented upon him, and whereof I Palmeta have entreated also in another place of this Worke) as stantely fundry dwarfe Date trees, whose formation of the palmeta for the particle of the palmeta for the particle of the palmeta for the palmeta for the particle of the palmeta for the pal

leaves have to import a turface that they terved them very finely to write on that is, with a small pointed fron, to engrave their characters therein. There is also growing in the Country of Mangi, which is here the Tartars Tal. and Chinefes, a certaine tree called Tal, and Vanetal, whose leaves are very large, and through all those Countries are used to be written on: it beareth fruite like mrogreat Turneps, whose meate under the outer rinde or tries are used to be written on: it beareth fruite like mrogreat Turneps, whose meate under the outer rinde or barks is tender, sweete and edible. Ovietes maketh mention of two certains trees growing in Hipanola, the Guajaba. Refer called Guajabara by the Indians, and by the Spaniard Overs, because the finite thereof are like Grapes: 74. the wood whereof is reddish, sound, and thicke, and fit to make coales, it beareth the fruite more lookly leparate in funder then the Grape, and of the colour of the Mulberry or Rose, having little substance thereon to be eaten, for they be as great as an Hasell Nut, and a stone within it is almost as great at the leaves of this tree are Bbbbbbb a

Papprife a

Guiabera. New Spaines

broad and round, ashigge as the palme of ones hand, as thicke as two Ivy leaves, and greene, and fometimes reddith, whereon the Spaniards uled to write with an iron pen or pointell on both fides of the leaves, but they must be fresh gathered and presently written upon, which Letters then will appeare white, in the greene or reddish leaves that they may be eatily read, notwithstanding the middle ribbe, and the other veines therein, in that they will not hinder ones hind very much. The other tree they call Copy, growing greater and taller, whose leaves are round like unto the other, but twice as large and thicke as they; and therefore better to write on, the middle

ribbe and veines being also smaller, and thereby hindering the pointell from the graving thereon fo much the lesse: these leaves also the Spaniards made use of for playing cards, engraving Arboru fo the formes of Kirgs, Queenes, &c. thereon, and trafex bra would not easily be broken. Nicholam Costinua in his journall letteth downe that neere the City Cael where pearles are found, there groweth a tree, whole leaves a e fo large that two or three men may be kept dry in their journeyes, having one of them foread to cover them, for they are of fixe braces or fathomes in length, and as many in breadth, which leaves also ferre them very fitly to write upon, each of them being so thinne and plyable withall, that being soulded up handand plyable withall that being toutoed up handfomely together, one may carry one of them in
their hand. Durer allo among his additiable
plants remembrett the Melt or Manger of the
Mexicaner, of tabler and Manger of the
Steen More Americana, tet forthe in the fecond
Classis of this Worke, of whose leaves they
made use to write or engrave what Records
they must be sent or write or engrave what Records they would keepe, or what elfe they thought arbor cluft good. Clasine also maketh mention in his first

Booke of Exotickes, and fourth Chapter, of two
Booke of Exotickes, and fourth Chapter, of two
forts of barkes of trees hit to write on: the one white and like unto the thinnest parchment which was gotten in

Iava, by those that returned from with Sir Francis Drake, in his long voyage over the world, which by tryall
was found fit to write on: And as he faith to might be was taken from that tree that Antonius Pigafetta maketh
mention of in his journall, that in the Manual Tidore, the women cover their privy parts, with a certains cloath made of the barke of a tree in this manner after it hath beene steeped so long in water that it is growne soft, they made of the barke of a tree in this manner a after it nath ocene iteeped to long in water that it is growne tott, they beate it with woodden milletianto what length and breadth they please, making it forthinne as filke, having the crofle veines running through it. And it may as likely be such as the Chineses make their paper, some Bookes of herbes being brought into the Low Countries as Clusture faith, having both the figures of the herbes in them, and the descriptions and whether the countries as Clusture, for they had Chineses Characters on the sides of the figures. The other barke of the crop what the chineses in the countries as the chineses of the sides of the figures. as no paper could be imported the plainer, and was not thicke or groffe but without any difficulty might be parted into fix leaves, each of them very well-enduring to be written on with our ordinary incke, and yet not finke any whit through it, which barke as he faith might have beene separated into more leaves if one would have been curious about them.

CHAP. CXLVI.

Palma pinus five Conifera. The Pine or Conebearing Palme tree.

His strange kinde of tree being brought by certaine English Merchants, or Marriners, from the parts of Guinea where they traded, was of a wonderfull composite, for the toppe bough with the fruite thereon, was as it were mixed of the nature of the Date, and Pinetree together, the wood being light and spongy, and wholly made of threds or haires, the outside or barke being like scales: it had about forty or fifty round yet fomewhat flat branches, a foote long in the fame manner scaly, or as it were

fet with hollow joyated cuppes or boxes, and from the joyats broke forth small copes like to those of the Cedar tree, fet with thicke scales of a pollished shining brownish colour, the outer shell being of the thickenesse of the

Indian Nut fiell, containing within it a certaine kernell like unto a long Ackorne or Chefant, of two inches long or leste, very hard and not easie to be made into meale, yet serving the Natives instead of bread.

Frustus squamos Palme altere smills. Another kinde of scaly fruite like the other Palme.

Another scaly fruite like hereunto was sent unto Clussus, but came a little after his death, which sheweth the stalke of the fruit divided into long fibers, the fruite also divided, whose inner substance betweene the outer shell and the inner kernell was blacke, the smaller end of which kernell lay next the bottome of the fruite a differing from those in the Cokar Nots.

Chameriphes peregrina Clusij. The Strange dwarfe Palme of Clusius.

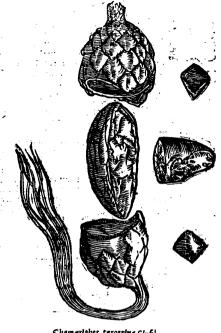

This branch Clusius referreth to the kinder of Palmeton as thinking it to partake with them : it tole up faith

Fruitus (quemojus Palme altere fimilis. Another kinde of scaly fruite like the other Palma.

he, with forty stalkes or more bigger and lesser, and longer or shorter then others, containing many appearances of flowers or fruites growing thereon, which were all rubbed off, onely the places where they stood, appearing and shewed as if they had beene all contained within a huske or covering, for the whole branch role from a certaine thicke barke, made as it were of shards like unto that of the outer shell of the Cokar Nut. or like unto that huske that covereth the Palmeto head, which barke was of a yellowish colour, smooth both above and below, but the stalkes were of a brownish colour : this seemed to be plucked from iome tree, but what or where is not expressed.

CHAP. CXLVII.

Gum Copal & Anime. Of Gum Copal and Gum Anime.

Hele two Gummes are gathered in the West Indies, as Historiola, co-c. being very like one unto another the Copal is of a rine cleare translucent pure white gum in formewhat great peeces, and pretty fweete, although not fo much as the Anime is, with this Gum the ledians used to ferfume their facrifices inflead of incense in their temples, and when the spanning first tame among them, they perfumed them therewich: it is hot in the second and moilt in the fifth degree, for it hath, some watery parts therein, it resolves wellings, and mollifieth hard tumours. Gomers in the first degree, the one paris therein, it refolveth (wellings, and mollifieth hard tumours? Gomare make the two forth hercof, the one mover rugged and foft then the other. But there hath been brought of late dayes an oilly of liquid (indifferent called Olean de copal Ivas, and is of two forts, the one yellowish, and of a move thicke indiance formewhat like unto that Balfamann that commeth from Hispaniola, the other white and move liquid, but of the fewer the former, both of them being excellent good for wounds the The Makine is a whitish gammer thaning out of great trees, and is not so cleare or pure white as the Copal, but more fairly like unto There or distanting yet in greater peeces then Olibanium and being broken is somewhat yellowish, and of a most sweet and pleasant sent tent being set on burning or cast on quicke coales, and is some consumed. There is another Gum Anime of Elisapia, bordering on Africa, which is called Orientale, to distinguish it from this West Gum, and is both clearer, whiter, and in greater peeces then this, and is so like unto white Ambar, that divers have taken it to be melted Ambar, and in greater peeces then this, and is to use unto write Amoar, thus divers nave taken it to be meteoral moar, and thereof have made beads, and braceles, &c. the tree from whence it commeth is great, flaving leaves like Mirtless but have here bettere shewed you the true originall of Ambar, even to be a Biramen, which has his fountaines in the German's Sel, and beginnest hard, after it lattraces a while in the aire. Of this Orientall Anime also, I have shewed you the opinion of divers, both in the Chapter of Lessa and Apole, first that there is three forts thereof, brought from Guiney, &c. by the Portugals and others, whereof that which is white is taken by Garbias Amaster Lustraniem and others, to be the true Cancaman of Dissertions, and called Anymam by the Portugals, feeving for perfumes and centings : Another fort which is browne is taken by divers to be the Myrbhe Aminnas of Disferiates, as is before faid: The third fort is dry, of a pale colour, and is easily broken like Roffin. The Well Gum Anime is of much use in the defluctions of rheume from the head, and other diseases of the head, rising from a cold cause, the head ache also and snegrime, and where there is want of sleepe to burne it, on a few quicke coales and aire ones head and their night cap with the moke, which warmeth and comforteth the parts very much: and is herein very like unto Thin: it is used likewise in platters to warme and strengthen the cold and weake sinewes or any other part of the body afflicted with cold: it comforteth also a cold stomacke and helpeth to dissolve winde: it is also het in the second and moist in the first degree.

CHAP. CXLIX.

Resina Americana quadam, Certaine West Indie Rossins

Here are divers other forts of gums Rossins; and liquours brought both from the East, but especially from the West parts, some whereof by good experience have given much helpe they to those that have used them: many other more then they have beene brought, whereof wee have knowne no use or name, nor have made any tryall what effect they carry, and therefore to avoyd

tediousnesse, and that this Worke being growne great, should not be overcharged with needlesse and unprofitable matter. I will onely in this Chapter shew you some of the chiefest that have beene either mentioned by others, or not fet forth before now. The first is the Refina Carthaginenfis fet forth by Monardas, that was gathered by Carthago nova in America, and is a most cleare and most sweet liquid Rossin excelling either the Venice or the true Turpentine in the effects. For it is by often experience found to be fingular good for wounds in the nerves and inewes and the joynts or for old fores in the legges and feece: women by washing and preparing it in a convenient manner, doe use it on their faces to take away wrinckles, spots, &c. and to preserve their youth Refina A- and beauty. Another fort is called allo by Monardun Refina Abiegna, that is Firre tree liquid Roffin or Turpentine tiegua In- and is gathered from great wilde trees that can neither be faid to be Firre or Cypreffe, being taller then Pine trees, and straight, growing up like the Cypresse: towards the toppe of these trees grow certaine bladders or skinnes some greater and others smaller, which being broken this admirable liquour droppeth forth, which the Indians carefully doe gather into fhells, but with a great deale of labour and trouble, and but a little in a great time. The use hereof is as effectuall as Balsamum, for all the causes for which Balsamum is used, for it excellently healeth all forts of wounds, and eafeth all paine: and griefes rifing from cold or flatulent matter: it is also fingular good against the paines or winde in the stomacke and bowels, to take some in white wine. A third fort of liquid substance is called Liquor Ambia and came to him in the hollownesse of a cane or Reede, and was taken out of a spring or fountsime in the ground, farre from the fea, being thin and yellow like bony, and fmelling like Tacamabaca, which was fignified unto him to be of excellent vertues; especially in cold inveserate griefes, and aches in any part of the body, and taketh away the cold shivering fits of agues: it resolvethalso all kindes of hard tumours, and performeth whatloever either Caranha or Tacamahacca can doe: it is of fo flicking and cleaving a fubflance, that it will not be pulled from the place whereon it is fet, untill by time the vertue is spent and it growne dry. Gum Colliman or Caramam, is a kinde of blacke gum almost as blacke as pitch, that Sir Walter Raleigh first brought from Guiana, and those parts, and brought it also first into use for a cold moist and rheumaticke braine, and giddiseffe the sof, and for defluxions of humours, as aches in the joynts or other parts, into the shoulders or other parts of the body, or for windinesse in them running from place to place, eyther by it selfe or sometimes mixed with Carantary Of it selfeit is very hard, and smelleth sweete, but being distilled is much sweeter, especially the last part, that commeth forth after the two first stinking oyles, and is used by some persumers as an excellent per-

The Theater of Plants. TREBE 17. fume. It is good also for resolutions, or as some call it the deed palsie, and for the paines of the mother, and the lower part of womens backes, which must be spread upon leather as a plaister and laid thereon, and not taken a-way till it fall of it felfe: it is also fingular good to ease the paines of the gout, and of excellent vertue in the cure of wounds: all these properties have beene found certaine by good experience. Barratta, is a most foveraigne Ballamum farreexcelling all others yet knowne, which by true experience is

found to be of especiall operation in the cure of greene wounds, and being burned upon coales is a most sweet per-

And thus to finish this whole Worke and bring is to a period, let me onely shew you some of those things not spoden off before in this volume, which have beene made knowne to us to grow in our severall plantations of Virginia, the Barmudas, New England, or ellewhere among our owne peoples habitations: and first,

The poyloned weed is like our English Ivy.

The purging Beane is a kinde of Woodbind, running on trees meete the Sea fide.

The Mancinell tree beareth a small apple like fruite, sweete in smell, but poyson to eate.

The Guane tree beareth a fruite as bigge as a Peate, and good to cate.

They have also Apple trees differing from ours.

Cherryes likewite as bigge as Damtons, and yellow Plummes divers from ours.

There is a bush like unto a Bramble that hath long yellow fruite within a hard shell.

Another tree they have that groweth great like a Pine tree that beareth stuite as great as a Muske Melon, is al-

wayes greene, and hath both blossomes, greene fruite, and ripe, all at a time. Wilde Figge trees like wife they have, wherewith they feede their fwine.

Then have they fmall red berryes which they call red Pepper.

Goodly great trees which they call Cedar, because the wood is red like Cedar, but the betryes are small like nn to Iuniper berryes.

Fulticke trees, which give a yellow colour fit for Dyets,

A great tree with whole leaves they make Multard. A kinde of roote which they tooke to be Sarfa parilla, but is not, although somewhat like it, being hard and

wooddy, and hath no use that we know-Marca nuts grow close to the groundlike unto Hazell Nuts.

Peniman is a kinde of filke graffe.

Woghfacan, with the roote they cure their hurts and discases.

Me Saminus are Grapes as great as Cherries, but with little juyce in them.

Rememens are like to our Goofeberryes.

Ocongheammins are berries like unto Capers.

Checinkamins like to Chefnuts.

Tocksbengb is the Cassada roote whereof they make bread.

Passaw is a fruite as bigge as an Apple, of an Orenge colour, and good to eate?

And now unto God Almighty Triano, and Vno in Trinitate, . who I hope thath beene at the beginning of this Worke, and holpen me through all the passages thereof, notwithstanding the walte discrimine versus merselies, whereof I have felt my part, to bring it to the end, for the benefit of others (who that they may make goodule thereof, and not pervent it to any similer course, is my earnest desire) be given all the praise, homour, and glo-Ty, for I am but (like the Bee, that worker out wage and hony for others, not his owne good s) his infirmment to accomplish it receiving all from Him. Amen.

THEATRO BOTANICO APPENDIX.

An Appendix to the Theater of Plants,

or Addition of those things have beene over-slipt, mistaken, or to be amended in the Worke Precedent, to be referred as the number of the Pages declare.

Where observe that p. standeth for Page.

15. Hy John Graco un lo adled by Alphan, is that fifteenth fort in page the third, there called Hiffons folis Origans. Round leafed Hy lope.

6. Thymbra Legitima Alpiro.
The true Savory by Alpinus. P.

is the source of a first section and inspection of the section of

The differing forms and face that Alpino giveth this (mall herbe from the former, hath made me intert it here to be referred to the other forts, it to be it be another. It is very like unto the true Tyme as he faith, but hath smaller and finderer translitis, and Tyme like leaves, many being set on them by couples, but thinner and fofter, and of an herby greene colour: the flowers are purple like Tyme and grow in spikes: it growth lowes then Tyme, smelleth very likes, and tastieth as sharpe as Tyme, when it is dryed.

19. Martin

10. Marum Ægyptiorum Alpino. Tie Egiptians Marum by Appine to be referred to p 13

The Egyptians Adjum by Alphan without fent.

This plant such Alphan without fent.

This plant such Alphan mathematical a Alphan with the Egiptians and growing among subtilifying in y places do to
lomewhat relemble a wild Chary in the least and growing,
being voyed of table or favour, especially the lowest, yet those
that the up with the flake and flowers, are flrong and not mipleasans, the leavest thereon biling of a cubic height are white
and boary, and the flowers like those of Clary, the feedla small
and round like Cabbage feed. They use to fay it among their
garments and Physically to expell winde to wer fully and to agarments, and Phylically to expell winde powerfully, and to abate swellings.

Origanum Indicam. Indian Organy,

Proper adjume in his Booke of Egiptian plants fetteth forth one, he said he there called Zatarends, and decicribeth it to grow flowly with sungry of said flakes and almost round thicke whitish leaves on them, full of sap or juyce, and very fweet, bearing neither flower nor fruite: they use it in their meates as others doe Origanum: thus much Alpinus. But Vemeates as taking upon him to correct and amendamenth him faith; that the plant called Satarhand by altern's this plant (whose figure. I here give you from him, and as he faith did fpring with Signior Coutarin of Chaice, it there be not form fallacy or militake in the matter, for besides that Alpaha-figure-half little similitude unto this, he faith, who it is likely observed it long by faying it grew flowly he observed in all the time of his abode in Egypt that it bore nothing; but as foone as it came into Contarinis hands, it bore according as other forts of Urigarum both flowers and fruite yet larger. I put this but as a doubt in

the matter) and describeth it in this manner. This dainty plant riseth up to a footes height, with straight stakes and soft tender Marjerome like leaves, upon them, covered with a whitish downe, or wooll, being almost round but pointed at the ends, with fundry pale coloured veines in them: It beareth many white flowers at the tops of the stalkes, bowing their round heads a little, which are made of many small leaves set together. It is somewhat aromaticall in talte with some pleasing acrymony, and a little astringent withall, but exceedeth in sweetnes that of Cardy.

2. Origanum Onitis Matthieli, White Organy of Girece. p. 15.

10. Polium Gnaphaloides.

The heary Poley mountaine.
This kind of Poley mountaine is wholly very heary white all over, and baving small leaves like small Myrtle leaves, a little deated about the edges, so thicke set on the lower crooked ftemme, that they cover it, from whence alower crooked itemme, that they cover it, from whence a-rife divers other flakes or branches, thinly fet with the like leaves, and at the toppe of each of them a round head or um-bell, upon a long bare flake, confifting of divers yellow flowers, flanding in their small cups, which growing ripe are turned into downe, and with the yellowish small loed is carryed away with the winde : the roote is small, flender, and long. Alpinosonly maketh mention hereof lib, de plan-

12. Origanum fiftulosum Cornato sed potine Mentastrum fiftulefum Americanum. A wild Mint of America.

The recree of this plant is wholly composed of long and imall fibres, which shooteth forth fundry iquare hairy stalkes halfe a yard high, fet with two long and somewhat broad leaves at the joynts somewhat refembling those of the Wil-low herbe: at the joynts come forth also divers branches with such like leaves thereon, but lesser up to the tops, where with first like leaves thereon, out letter up to the tops, where shad ten or twelve small seaves in compasse, where head, composed of a number of pale reddish purple flowers, resembling the head of a Scalion, each flower being long, and hollow, biforked at the ead, with two or three threas tipt with purples in the middle of this round head shooteth forth fometimes fuch another round head of flowers, with leaves under thems the whole plant both stalke, and leaves are covered with an hoary downe, and smelleth like Savory but tafteth sharpe and fiery like Arsmart, yet the roote hath no talte at all.

Scordium, of water Germander. p. 110.

Scordistus fring jum ederatum.
Thorny (watt Scordism or Water Germander.

This annuals. Scottlinus rifecth up, with fourare foft and hairy pathes full of joynes or branches, which are fatty or clammy, whereas grow fometimes two, but at the greater joyne three leaves, which are variously formed, the lowest being largest, are denoted or cus on the edges, like anto the ordinary or Water Germander, but till up higher the smaller and lesse denoted, at the joynes of the branches grow many times long thornes, but alwayes end in a small long for pricise or thorne, and at the leaves also come forth small Germanderiske flowers, but whites the with three small threes within them a in the huskes that contained the flowers, being false rife fower small feeds which must be sowne every yeare: the roote is very long and fibrous, and pershing after seed time: the whole plant smelleth simple as fweet as Basilia, and was gathered upon some of the dry, barrest and fandy mountaines in Spaine, and mentioned onely by Cornatus in his Canado relations.

Having another figure of this Valerian by me, differing in former, I thought good to exhibit it likewife into you, that you may fee how the alteration of climates cauleth fuch formal divertities as any here perceived in rootes, leaves, and flowers:

18,29. After Americanist priesteles es ferentiasis latifalien, es angustifation. Two forts of Virginia Starreworth. p. 13.2.

To the end of the 25 Chapter of the second Classis, page 216. adde these words. But Petrus Castellus hath published a Tractate Printed at Rome 1612. inquarto, or as he calleth it an Epittle to Isbanes Menelphus, and Aesius Cleius, wherein he contesteth, that the Hellborus simply so called, as well in the Workes of Hippocrates, as other Authors entreating thereof, is to be understood of the white kinde, wherewith both the mad daughters of Pretrus King of the Argives were cured, as also Hercules madnesse by the Anticyrous medicines (whose seed being like unto Cnicus was called Sesamoides) whose affections I am sure are quite contrary to Dioscorides, that directly appropriate the cure of Petrus daughters unto the blacke Ellebore, and therefore called also Melampodium, because Melampus the Goat heard plaid the Physicion therein.

3. Acacalis Camerario Bollonio & alijs. A Syrian plant like unto the Carob tree.

Being omitted in page 236, where it was entended to be feet forth, that it be not utterly left out, accept it in this place. Palendamu laith Baubinn, in his returne from his Egiptian, Syrian, &c. peregrination Anno 1579. brought fome feedes of a Syrian plant, called there Kifmifen, which being fowne brought forth round leaves, which he doubted was the Acacalis of Diofeorides Camerarius also saith that he (as it is likely having received of the same seeds from Paladamu,) sowed some seed that was eight yeares old, sent him by the name of Acacalis, and called in the Syriack tongue Kifmifen, and Sifme, from whence rose a tender plant. Somewhat like unto the Carob tree, upon the first springing of it, having gained that yeare onely sour round leaves, set by couples, each opposite to other on the middle rib, whose stalke was somewhat hairy: This perished also at the beginning of Autumne, so that no more can be said thereof, but that the seed was somewhat broad and round at the one end, and pointed at the other. But although this bore the name of Acacalis, yet did it not answer to Dioscorides Text, or Egiptian that transcribed it from him) that saith it is the fruite of an Egiptian plant; that is somewhat like unto Tamariske. Cordon commenting on Dioscorides, saith it was not knowne in his time, unlesse some would referre it to the Eimblick or Bellirick Myrobolanes, which is as farre from truth, as an Oake from an Apple. Bellonius also remembreth it, but giveth no description of it: So that neither being perfectly described by Dioscorides, nor certainely knowne of our Modernes, I can say no more thereof.

Myrobalant

2. Myrobolani (bebuli at fertur Icon vera, A true figure of the purple Myrobalane or purging Indian Plumme.

Vellingius in his furvay of Alpinus his Egiptian plants faith, that he often faw in the Orchard of a certaine chiefe Turke, a tree growing, which the keeper therof called Dileg el chabul, growing to be as bigge as a Plume tree, with a (mooth pale coloured barke, the wood being whitiff and fomewhat fweet, the branches foread fairely and thicke, bending easily and hardly breaking, armed with tharpe long thornes : the teaves are fet by couples together on a fhort footestalke, being fomewhat long with the roundnesse, and a little round pointed (nothing like unto Pearly leaves, as is formerly fet downe) the lower ones being larger then those upward on the same branch: and without any dent on the edge. The fruite is of a reasonable great esta; bigge in the middle, and small at both ends, and of a danke or blackish red colour, and somewhat sapide, They use to preserve them, and so impart them. to those of the greatest ranke, and have a purging quality in them.

& Rubia Sylve firis argentoa Cretica. Silver-like wilde Madder of Candy.

This small Candy white Madder, from a small long stender roote shootes forth divers stakes, not halte a foote long, with sundry small; long, foft and silver coloured leaves set by spaces, some times but two, other whiles foure at a space, and with them upwards to the toppe, small yellowish slowers, it is without any other taste then a little aftringent, and is said to be profitable for slugges in man or woman.

8. Rubra sy'vestris argentea Cretica.
Silver like wild Madder of Cands. P 277.

2. Myrobolani Chebuli mi farint 1600 vera.

A branch of the true Chebuli Myrobolane, or purple purging
Indian Plume as it is thought, to be referred to '9.246.

Capaos Jabacca radice.

Beontens Holmertet, or (mall round roored Furniterry. p. 288.

Page 380, Line the fixteenth, put out Panaces Carpimon five racemofine Canadenfe, but why Panax being no wound herbe, I fee no canfe, unlesse it be for want of a better name, put out as I faid all this, because it pertained to amother place.

Page 380. Line the fixteenth, put our those three last lines in the Nomes, and instead of them put Aconium baccu nibein of rubries but I thinke I have more truely referred it to the Christophorians. In the Versues likewise put out the Panaces Carpinon, and all that followeth, and in the place thereof fetthes lines. Cornutum saith, they gave it the name of Aconium, rather from the likenesse unto an Aconium from any delicerial quality they knew to be in it, and supposeth that the white berries should rather portend good then harme.

Page 287. Lines part of the 18 19 and part of the 20, are to be strucke out, not being intended for that place. as may plainely be differned by the relation. And in the ftead thereof read thefe lines? The fourth is called by Clusium Apocynum Syriacum Falestirum, & forte Egyptium, because he referreth it to the Beidelfar of Alpinum in his Booke of Egiptian plants, and to the Offen frutex of Honorius Bellus in his third Epistle to him, saying withall, that Doctor Christopher Weixiw gave him the dived branch, which he fet forth, and that as he told him he gathered it neere the River Iordan, in Paleffina where it grew, and the people there called it Beidfar : this is Clufes his relation and judgement thereof: I have faid somewhat hereof in my former Booke, page 444. But I would to explaine it the better, adde somewhat more thereunto. First that it is not probable to me that this plant which Clufius fetteth forth (and is without all question the very same that rose with me from the seed was brought out of New England upon the fifth discovery thereof, both stalkes, leaves, and flowers, agreeing so exactly thereunto, and both forme and colour of the flowers answering it in every point, onely the pods white feed answereth not unto this, which I doubt therefore is but misselen) should be found naturall to those parts, seeaniwereth not unto this, which I doubt therefore is our mittaken) thousand be found actual to those parts, seeing as I faid it is natural to Usinginia, or New England, and Generally that the name Beidfar should be given to it, which is most probable balongeth to that of Alpinua, and Beiliau, which is quite a differing plant from this as I showed in my former Booke, both from the growing hereof, which dyeth downe every yeare, and from the milke it giverh, which is not causticke like the Offar, and in the rootes which are running under ground, which the o ther doth not. And thirdly, they fay that the Offer or Beidelfer beareth yellow flowers, and not expressed to grow in clusteness this doth; and tastly, that the pods of this Apoconom are crooked, according to the forme expressed in the figure, when as those of Osar are round like Testicles, and those that Cluston settles forth are not crooked like unto these. Bearing in following Cluston, showeth that he never saw the plant, and therefore taketh it for granned whatsoever he said, or Weixing informed him, when as by this that I have here delivered it is probable Weixing was mistaken, and that hath caused all these errours: as also that of Banking, that would make it a kinde of Docke, calling it Lapathum Ægyptiacum lattefens filiqua Afelepiadu, which hath so little correspondence with reason and judgement, that I wonder that so samous an Herbarist as Bankinsa was, should relyeupon anothers foolish opinion in the denomination thereof, and so divulge it to the world, whereof I have formerly faid something: The fifth is remembred by Cornners, among his Canada plants.

Ranneulus filvaram five Anemone filvefiris fore pleso albo. The double white wilde Anemone to be inferred in p.325.
